Introduction

The MISP threat sharing platform is a free and open source software helping information sharing of threat intelligence including cyber security indicators, financial fraud or counter-terrorism information. The MISP project includes multiple sub-projects to support the operational requirements of analysts and improve the overall quality of information shared.

MISP galaxy is a simple method to express a large object called cluster that can be attached to MISP events or attributes. A cluster can be composed of one or more elements. Elements are expressed as key-values. There are default vocabularies available in MISP galaxy but those can be overwritten,

replaced or updated as you wish. Existing clusters and vocabularies can be used as-is or as a template. MISP distribution can be applied to each cluster to permit a limited or broader distribution scheme. The following document is generated from the machine-readable JSON describing the MISP galaxy.

Funding and Support

The MISP project is financially and resource supported by CIRCL Computer Incident Response Center Luxembourg .

circl.lu
Computer Incident
Response Center
LUXEMBOURG

A CEF (Connecting Europe Facility) funding under CEF-TC-2016-3 - Cyber Security has been granted from 1st September 2017 until 31th August 2019 as **Improving MISP as building blocks for next-generation information sharing**.

Co-financed by the European Union
Connecting Europe Facility

If you are interested to co-fund projects around MISP, feel free to get in touch with us.

MISP galaxy

360.net Threat Actors

Known or estimated adversary groups as identified by 360.net..

360.net Threat Actors is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

Android

Android malware galaxy based on multiple open sources..

> Android is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Unknown

CopyCat

CopyCat is a fully developed malware with vast capabilities, including rooting devices, establishing persistency, and injecting code into Zygote – a daemon responsible for launching apps in the Android operating system – that allows the malware to control any activity on the device.

The tag is: *misp-galaxy:android="CopyCat"*

Table 43. Table References

Links
https://blog.checkpoint.com/2017/07/06/how-the-copycat-malware-infected-android-devices-around-the-world/

Andr/Dropr-FH

Andr/Dropr-FH can silently record audio and video, monitor texts and calls, modify files, and ultimately spawn ransomware.

The tag is: *misp-galaxy:android="Andr/Dropr-FH"*

Andr/Dropr-FH is also known as:

- GhostCtrl

View relationships graph

Andr/Dropr-FH has relationships with:

- similar: misp-galaxy:malpedia="GhostCtrl" with estimative-language:likelihood-probability="likely"

Table 44. Table References

Judy

The malware, dubbed Judy, is an auto-clicking adware which was found on 41 apps developed by a Korean company. The malware uses infected devices to generate large amounts of fraudulent clicks on advertisements, generating revenues for the perpetrators behind it.

The tag is: *misp-galaxy:android="Judy"*

Table 45. Table References

RedAlert2

The trojan waits in hiding until the user opens a banking or social media app. When this happens, the trojan shows an HTML-based overlay on top of the original app, alerting the user of an error, and asking to reauthenticate. Red Alert then collects the user's credentials and sends them to its C&C server.

The tag is: *misp-galaxy:android="RedAlert2"*

View relationships graph

RedAlert2 has relationships with:

- similar: misp-galaxy:malpedia="RedAlert2" with estimative-language:likelihood-probability="likely"

https://www.threatfabric.com/blogs/new_android_trojan_targeting_over_60_banks_and_social_apps.html

Tizi

Tizi is a fully featured backdoor that installs spyware to steal sensitive data from popular social

media applications. The Google Play Protect security team discovered this family in September 2017 when device scans found an app with rooting capabilities that exploited old vulnerabilities. The team used this app to find more applications in the Tizi family, the oldest of which is from October 2015. The Tizi app developer also created a website and used social media to encourage more app installs from Google Play and third-party websites.

The tag is: *misp-galaxy:android="Tizi"*

Table 47. Table References

DoubleLocker

DoubleLocker can change the device's PIN, preventing victims from accessing their devices, and also encrypts the data requesting a ransom. It will misuse accessibility services after being installed by impersonating the Adobe Flash player - similar to BankBot.

The tag is: *misp-galaxy:android="DoubleLocker"*

View relationships graph

DoubleLocker has relationships with:

- similar: misp-galaxy:malpedia="DoubleLocker" with estimative-language:likelihood-probability="likely"

Table 48. Table References

Links

Svpeng

Svpeng is a Banking trojan which acts as a keylogger. If the Android device is not Russian, Svpeng will ask for permission to use accessibility services. In abusing this service it will gain administrator rights allowing it to draw over other apps, send and receive SMS and take screenshots when keys are pressed.

The tag is: *misp-galaxy:android="Svpeng"*

Svpeng is also known as:

- Invisble Man

View relationships graph

Svpeng has relationships with:

- similar: misp-galaxy:tool="Svpeng" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="Svpeng" with estimative-language:likelihood-probability="likely"

LokiBot

LokiBot is a banking trojan for Android 4.0 and higher. It can steal the information and send SMS messages. It has the ability to start web browsers, and banking applications, along with showing notifications impersonating other apps. Upon attempt to remove it will encrypt the devices' external storage requiring Bitcoins to decrypt files.

The tag is: *misp-galaxy:android="LokiBot"*

View relationships graph

LokiBot has relationships with:

- similar: misp-galaxy:malpedia="Loki Password Stealer (PWS)" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="LokiBot" with estimative-language:likelihood-probability="likely"

Table 50. Table References

Links
https://clientsidedetection.com/lokibot_the_first_hybrid_android_malware.html

BankBot

The main goal of this malware is to steal banking credentials from the victim’s device. It usually impersonates flash player updaters, android system tools, or other legitimate applications.

The tag is: *misp-galaxy:android="BankBot"*

View relationships graph

BankBot has relationships with:

- similar: misp-galaxy:malpedia="Anubis (Android)" with estimative-language:likelihood-probability="likely"

WannaLocker

WannaLocker is a strain of ransomware for Android devices that encrypts files on the device's external storage and demands a payment to decrypt them.

The tag is: *misp-galaxy:android="WannaLocker"*

Table 56. Table References

Links
https://fossbytes.com/wannalocker-ransomware-wannacry-android/

Switcher

Switcher is a Trojan horse for Android devices that modifies Wi-Fi router DNS settings. Swticher attempts to infiltrate a router's admin interface on the devices' WIFI network by using brute force techniques. If the attack succeeds, Switcher alters the DNS settings of the router, making it possible to reroute DNS queries to a network controlled by the malicious actors.

The tag is: *misp-galaxy:android="Switcher"*

View relationships graph

Switcher has relationships with:

- similar: misp-galaxy:malpedia="Switcher" with estimative-language:likelihood-probability="likely"

Table 57. Table References

GM Bot

GM Bot – also known as Acecard, SlemBunk, or Bankosy – scams people into giving up their banking log-in credentials and other personal data by displaying overlays that look nearly identical to banking apps log-in pages. Subsequently, the malware intercepts SMS to obtain two-factor authentication PINs, giving cybercriminals full access to bank accounts.

The tag is: *misp-galaxy:android="GM Bot"*

GM Bot is also known as:

- Acecard
- SlemBunk
- Bankosy

View relationships graph

GM Bot has relationships with:

Adwind

Adwind is a backdoor written purely in Java that targets system supporting the Java runtime environment. Commands that can be used, among other things, to display messages on the system, open URLs, update the malware, download/execute files, and download/load plugins. According to the author, the backdoor component can run on Windows, Mac OS, Linux and Android platforms providing rich capabilities for remote control, data gathering, data exfiltration and lateral movement.

The tag is: *misp-galaxy:android="Adwind"*

Adwind is also known as:

- AlienSpy
- Frutas
- Unrecom
- Sockrat
- Jsocket
- jRat
- Backdoor:Java/Adwind

View relationships graph

Adwind has relationships with:

Loapi

A malware strain known as Loapi will damage phones if users don't remove it from their devices. Left to its own means, this modular threat will download a Monero cryptocurrency miner that will overheat and overwork the phone's components, which will make the battery bulge, deform the phone's cover, or even worse. Discovered by Kaspersky Labs, researchers say Loapi appears to have evolved from Podec, a malware strain spotted in 2015.

The tag is: *misp-galaxy:android="Loapi"*

Table 455. Table References

Podec

Late last year, we encountered an SMS Trojan called Trojan-SMS.AndroidOS.Podec which used a very powerful legitimate system to protect itself against analysis and detection. After we removed the protection, we saw a small SMS Trojan with most of its malicious payload still in development. Before long, though, we intercepted a fully-fledged version of Trojan-SMS.AndroidOS.Podec in early 2015. The updated version proved to be remarkable: it can send messages to premium-rate numbers employing tools that bypass the Advice of Charge system (which notifies users about the price of a service and requires authorization before making the payment). It can also subscribe users to premium-rate services while bypassing CAPTCHA. This is the first time Kaspersky Lab has encountered this kind of capability in any Android-Trojan.

The tag is: *misp-galaxy:android="Podec"*

Table 456. Table References

Links
https://securelist.com/sms-trojan-bypasses-captcha/69169//

Chamois

Chamois is one of the largest PHA families in Android to date and is distributed through multiple channels. While much of the backdoor version of this family was cleaned up in 2016, a new variant emerged in 2017. To avoid detection, this version employs a number of techniques, such as implementing custom code obfuscation, preventing user notifications, and not appearing in the device's app list. Chamois apps, which in many cases come preloaded with the system image, try to trick users into clicking ads by displaying deceptive graphics to commit WAP or SMS fraud.

The tag is: *misp-galaxy:android="Chamois"*

IcicleGum

IcicleGum is a spyware PHA family whose apps rely on versions of the Igexin ads SDK that offer dynamic code-loading support. IcicleGum apps use this library's code-loading features to fetch encrypted DEX files over HTTP from command-and-control servers. The files are then decrypted and loaded via class reflection to read and send phone call logs and other data to remote locations.

The tag is: *misp-galaxy:android="IcicleGum"*

View relationships graph

IcicleGum has relationships with:

- similar: misp-galaxy:android="Igexin" with estimative-language:likelihood-probability="likely"

Table 458. Table References

https://source.android.com/security/reports/Google_Android_Security_2017_Report_Final.pdf

BreadSMS

BreadSMS is a large SMS-fraud PHA family that we started tracking at the beginning of 2017. These apps compose and send text messages to premium numbers without the user's consent. In some cases, BreadSMS apps also implement subscription-based SMS fraud and silently enroll users in services provided by their mobile carriers. These apps are linked to a group of command-and-control servers whose IP addresses change frequently and that are used to provide the apps with premium SMS numbers and message text.

The tag is: *misp-galaxy:android="BreadSMS"*

Table 459. Table References

Links
https://source.android.com/security/reports/Google_Android_Security_2017_Report_Final.pdf

JamSkunk

JamSkunk is a toll-fraud PHA family composed of apps that subscribe users to services without their consent. These apps disable Wi-Fi to force traffic to go through users' mobile data connection and then contact command-and-control servers to dynamically fetch code that tries to bypass the network's WAP service subscription verification steps. This type of PHA monetizes their abuse via WAP billing, a payment method that works through mobile data connections and allows users to easily sign up and pay for new services using their existing account (i.e., services are billed directly by the carrier, and not the service provider; the user does not need a new account or a different form of payment). Once authentication is bypassed, JamSkunk apps enroll the device in services that the user may not notice until they receive and read their next bill.

The tag is: *misp-galaxy:android="JamSkunk"*

Expensive Wall

Expensive Wall is a family of SMS-fraud apps that affected a large number of devices in 2017.

Expensive Wall apps use code obfuscation to slow down analysis and evade detection, and rely on the JS2Java bridge to allow JavaScript code loaded inside a Webview to call Java methods the way Java apps directly do. Upon launch, Expensive Wall apps connect to command-and-control servers to fetch a domain name. This domain is then contacted via a Webview instance that loads a webpage and executes JavaScript code that calls Java methods to compose and send premium SMS messages or click ads without users' knowledge.

The tag is: *misp-galaxy:android="Expensive Wall"*

BambaPurple

BambaPurple is a two-stage toll-fraud PHA family that tries to trick users into installing it by disguising itself as a popular app. After install, the app disables Wi-Fi to force the device to use its 3G connection, then redirects to subscription pages without the user's knowledge, clicks subscription buttons using downloaded JavaScript, and intercepts incoming subscription SMS messages to prevent the user from unsubscribing. In a second stage, BambaPurple installs a backdoor app that requests device admin privileges and drops a .dex file. This executable checks to make sure it is not being debugged, downloads even more apps without user consent, and displays ads.

The tag is: *misp-galaxy:android="BambaPurple"*

KoreFrog

KoreFrog is a family of trojan apps that request permission to install packages and push other apps onto the device as system apps without the user's authorization. System apps can be disabled by the user, but cannot be easily uninstalled. KoreFrog apps operate as daemons running in the background that try to impersonate Google and other system apps by using misleading names and icons to avoid detection. The KoreFrog PHA family has also been observed to serve ads, in addition to apps.

The tag is: *misp-galaxy:android="KoreFrog"*

Gaiaphish

Gaiaphish is a large family of trojan apps that target authentication tokens stored on the device to abuse the user's privileges for various purposes. These apps use base64-encoded URL strings to avoid detection of the command-and-control servers they rely on to download APK files. These files contain phishing apps that try to steal GAIA authentication tokens that grant the user permissions to access Google services, such as Google Play, Google+, and YouTube. With these tokens, Gaiaphish apps are able to generate spam and automatically post content (for instance, fake app ratings and comments on Google Play app pages)

The tag is: *misp-galaxy:android="Gaiaphish"*

https://www.bleepingcomputer.com/news/security/new-reddrop-android-spyware-records-nearby-audio/

HenBox

HenBox apps masquerade as others such as VPN apps, and Android system apps; some apps carry legitimate versions of other apps which they drop and install as a decoy technique. While some of legitimate apps HenBox uses as decoys can be found on Google Play, HenBox apps themselves are found only on third-party (non-Google Play) app stores. HenBox apps appear to primarily target the Uyghurs – a Turkic ethnic group living mainly in the Xinjiang Uyghur Autonomous Region in North West China. HenBox has ties to infrastructure used in targeted attacks, with a focus on politics in South East Asia. These attackers have used additional malware families in previous activity dating to at least 2015 that include PlugX, Zupdax, 9002, and Poison Ivy. HexBox apps target devices made by Chinese consumer electronics manufacture, Xiaomi and those running MIUI, Xiaomi's operating system based on Google Android. Furthermore, the malicious apps register their intent to process certain events broadcast on compromised devices in order to execute malicious code. This is common practice for many Android apps, however, HenBox sets itself up to trigger based on alerts from Xiaomi smart-home IoT devices, and once activated, proceeds in stealing information from a

myriad of sources, including many mainstream chat, communication and social media apps. The stolen information includes personal and device information.

The tag is: *misp-galaxy:android="HenBox"*

Skygofree

At the beginning of October 2017, we discovered new Android spyware with several features previously unseen in the wild. In the course of further research, we found a number of related samples that point to a long-term development process. We believe the initial versions of this malware were created at least three years ago – at the end of 2014. Since then, the implant's functionality has been improving and remarkable new features implemented, such as the ability to record audio surroundings via the microphone when an infected device is in a specified location; the stealing of WhatsApp messages via Accessibility Services; and the ability to connect an infected device to Wi-Fi networks controlled by cybercriminals. We observed many web landing pages that mimic the sites of mobile operators and which are used to spread the Android implants. These domains have been registered by the attackers since 2015. According to our telemetry, that was the year the distribution campaign was at its most active. The activities continue: the most recently observed domain was registered on October 31, 2017. Based on our KSN statistics, there are several infected individuals, exclusively in Italy. Moreover, as we dived deeper into the investigation, we discovered several spyware tools for Windows that form an implant for exfiltrating sensitive data on a targeted machine. The version we found was built at the beginning of 2017, and at the moment we are not sure whether this implant has been used in the wild. We named the malware Skygofree, because we found the word in one of the domains.

BusyGasper

A new family of spyware for Android grabbed the attention of security researchers through its unusual set of features and their original implementation. Tagged BusyGasper by security experts at Kaspersky, the malware stands out through its ability to monitor the various sensors present on the targeted phone. Based on the motion detection logs, it can recognize the opportune time for running and stopping its activity.

The tag is: *misp-galaxy:android="BusyGasper"*

GodFather

The Android banking Trojan Godfather is currently being utilized by cybercriminals to attack users of popular financial services across the globe. Godfather is designed to allow threat actors to harvest login credentials for banking applications and other financial services, and drain the accounts. To date, its victims include users of over 400 international targets, including banking applications, cryptocurrency wallets, and crypto exchanges. Few people realize that hiding under Godfather's hood is an old banking Trojan called Anubis, whose functionality has become outdated due to Android updates and the efforts of malware detection and prevention providers. Group-IB first detected Godfather, a mobile banking Trojan that steals the banking and cryptocurrency exchange credentials of users, in June 2021. Almost a year later, in March 2022, researchers at Threat Fabric were the first to mention the banking Trojan publicly. A few months later, in June, the Trojan stopped being circulated. One of the reasons, Group-IB analysts believe, why Godfather was taken out of use was for developers to update the Trojan further. Sure enough, Godfather reappeared in September 2022, now with slightly modified WebSocket functionality.

Coper

Octo, also known as Coper or ExobotCompact, is an Android banking Trojan that evolved from the Exobot malware family, first observed in 2016. Initially based on the Marcher Trojan, Exobot targeted financial institutions globally until 2018, when a lighter version, ExobotCompact, emerged. By 2021, a new variant appeared, named Coper by some antivirus vendors, but later renamed as Octo — a rebranded and enhanced ExobotCompact. In 2024, Octo2, an even more advanced iteration, was released, driven partly by the leak of Octo's source code. The Malware-as-a-Service (MaaS) model makes Octo accessible to even novice cybercriminals.

Azure Threat Research Matrix

The purpose of the Azure Threat Research Matrix (ATRM) is to educate readers on the potential of Azure-based tactics, techniques, and procedures (TTPs). It is not to teach how to weaponize or specifically abuse them. For this reason, some specific commands will be obfuscated or parts will be omitted to prevent abuse..

Azure Threat Research Matrix is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

Adversaries may configure a Function Application with a user account or managed identity and modify the HTTP trigger to run a command via HTTP request.

The tag is: *misp-galaxy:atrm="AZT503.2 - Function App HTTP Trigger"*

Table 530. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT503/AZT503-2

AZT503.3 - Runbook Webhook

Adversaries may create a webhook to a Runbook which allows unauthenticated access into an Azure subscription or tenant.

The tag is: *misp-galaxy:atrm="AZT503.3 - Runbook Webhook"*

Table 531. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT503/AZT503-3

AZT503.4 - WebJob

Adversaries may create a WebJob on a App Service which allows arbitrary background tasks to be run on a set schedule

The tag is: *misp-galaxy:atrm="AZT503.4 - WebJob"*

Table 532. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT503/AZT503-4

AZT504 - Watcher Tasks

By configurating a watcher task and a Runbook, an adversary can establish persistence by executing the Runbook on a triggered event.

The tag is: *misp-galaxy:atrm="AZT504 - Watcher Tasks"*

Table 533. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT504/AZT504

AZT505 - Scheduled Jobs

Adversaries may create a schedule for a Runbook to run at a defined interval.

The tag is: *misp-galaxy:atrm="AZT505 - Scheduled Jobs"*

Table 534. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT505/AZT505-1

AZT506 - Network Security Group Modification

Adversaries can modify the rules in a Network Security Group to establish access over additional ports.

The tag is: *misp-galaxy:atrm="AZT506 - Network Security Group Modification"*

Table 535. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT506/AZT506

AZT507 - External Entity Access

Adversaries may configure the target Azure tenant to be managed by another, externel tenant, or its users.

The tag is: *misp-galaxy:atrm="AZT507 - External Entity Access"*

Table 536. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT507/AZT507

AZT507.1 - Azure Lighthouse

Adversaries may utilize Azure Lighthouse to manage the target tenant from an external tenant

The tag is: *misp-galaxy:atrm="AZT507.1 - Azure Lighthouse"*

Table 537. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT507/AZT507-1

AZT507.2 - Microsoft Partners

Adversaries may use Delegated Administrative Privileges to give themselves administrator access to the target tenant.

The tag is: *misp-galaxy:atrm="AZT507.2 - Microsoft Partners"*

Table 538. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT507/AZT507-2

AZT507.3 - Subscription Hijack

An adversary may transfer a subscription from a target tenant to an attacker-controlled tenant. This retains the billing account setup by the target and the target tenant administrators will no longer have control over the subscription.

The tag is: *misp-galaxy:atrm="AZT507.3 - Subscription Hijack"*

Table 539. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT507/AZT507-3

AZT507.4 - Domain Trust Modification

An adversary may add an additional identity provider or domain to maintain a backdoor into the tenant.

The tag is: *misp-galaxy:atrm="AZT507.4 - Domain Trust Modification"*

Table 540. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT507/AZT507-4

AZT508 - Azure Policy

By configuring a policy with the 'DeployIfNotExists' definition, an adverary may establish persistence by creating a backdoor when the policy is triggered.

The tag is: *misp-galaxy:atrm="AZT508 - Azure Policy"*

Table 541. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/Persistence/AZT508/AZT508

AZT601 - Steal Managed Identity JsonWebToken

An adverary may utilize the resource's functionality to obtain a JWT for the applied Managed Identity Service Principal account.

The tag is: *misp-galaxy:atrm="AZT601 - Steal Managed Identity JsonWebToken"*

Table 542. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/CredentialAccess/AZT601/AZT601

AZT601.1 - Virtual Machine IMDS Request

By utilizing access to IMDS, an attacker can request a JWT for a Managed Identity on an Azure VM if they have access to execute commands on the system.

The tag is: *misp-galaxy:atrm="AZT601.1 - Virtual Machine IMDS Request"*

Table 543. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/CredentialAccess/AZT601/AZT601-1

AZT601.2 - Azure Kubernetes Service IMDS Request

By utilizing access to IMDS, an attacker can request a JWT for a Managed Identity on an AKS Cluster if they have access to execute commands on the system.

The tag is: *misp-galaxy:atrm="AZT601.2 - Azure Kubernetes Service IMDS Request"*

Table 544. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/CredentialAccess/AZT601/AZT601-2

AZT601.3 - Logic Application JWT PUT Request

If a Logic App is using a Managed Identity, an adversary can modify the logic to make an HTTP POST request to reveal the Managed Identity's JWT.

The tag is: *misp-galaxy:atrm="AZT601.3 - Logic Application JWT PUT Request"*

Table 545. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/CredentialAccess/AZT601/AZT601-3

AZT601.4 - Function Application JWT GET Request

If a Function App is using a Managed Identity, an adversary can modify the logic respond to an HTTP GET request to reveal the Managed Identity's JWT.

The tag is: *misp-galaxy:atrm="AZT601.4 - Function Application JWT GET Request"*

Table 546. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/CredentialAccess/AZT601/AZT601-4

AZT601.5 - Automation Account Runbook

If an Automation Account is using a Managed Identity, an adversary can create a Runbook to request the Managed Identity's JWT.

The tag is: *misp-galaxy:atrm="AZT601.5 - Automation Account Runbook"*

Table 547. Table References

Links
https://microsoft.github.io/Azure-Threat-Research-Matrix/CredentialAccess/AZT601/AZT601-5

AZT602 - Steal Service Principal Certificate

If a Runbook is utilizing a 'RunAs' account, then an adversary may manipulate the Runbook to reveal the certificate the Service Principal is using for authentication.

The tag is: *misp-galaxy:atrm="AZT602 - Steal Service Principal Certificate"*

Table 548. Table References

attck4fraud

attck4fraud - Principles of MITRE ATT&CK in the fraud domain.

attck4fraud is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Francesco Bigarella - Christophe Vandeplas

Phishing

In the context of ATT&CK for Fraud, phishing is described as the sending of fraudulent emails to a large audience in order to obtain sensitive information (PII, credentials, payment information). Phishing is never targeted to a specific individual or organisation. Phishing tries to create a sense of urgency or curiosity in order to capture the victim.

The tag is: *misp-galaxy:financial-fraud="Phishing"*

ATM skimming

ATM Skimming refers to the act of capturing the data stored on a bank cards (tracks) and the Personal Identification Number (PIN) associated to that card. Upon obtaining the data, the criminal proceeds to encode the same information into a new card and use it in combination with the PIN to perform illicit cash withdrawals. ATM Skimming is often achieved with a combination of a skimmer device for the card and a camera to capture the PIN.

The tag is: *misp-galaxy:financial-fraud="ATM skimming"*

ATM skimming is also known as:

- Skimming - CPP ATM

Table 598. Table References

Links
https://www.association-secure-transactions.eu/industry-information/fraud-definitions/

Identity Spoofing (or entity hacking)

Identity Spoofing refers to the action of assuming (i.e., taking on) the identity of some other entity (human or non-human) and then using that identity to accomplish a goal. An adversary may craft messages that appear to come from a different principle or use stolen / spoofed authentication credentials. Alternatively, an adversary may intercept a message from a legitimate sender and attempt to make it look like the message comes from them without changing its content. The latter form of this attack can be used to hijack credentials from legitimate users. Identity Spoofing attacks need not be limited to transmitted messages - any resource that is associated with an identity (for example, a file with a signature) can be the target of an attack where the adversary attempts to change the apparent identity

The tag is: *misp-galaxy:financial-fraud="Identity Spoofing (or entity hacking)"*

Table 599. Table References

Backdoor

A list of backdoor malware..

Backdoor is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

raw-data

WellMess

Cross-platform malware written in Golang, compatible with Linux and Windows. Although there are some minor differences, both variants have the same functionality. The malware communicates with a CnC server using HTTP requests and performs functions based on the received commands. Results of command execution are sent in HTTP POST requests data (RSA-encrypted). Main functionalities are: (1) Execute arbitrary shell commands, (2) Upload/Download files. The PE variant of the infection, in addition, executes PowerShell scripts. A .Net version was also observed in the wild.

The tag is: *misp-galaxy:backdoor="WellMess"*

View relationships graph

WellMess has relationships with:

- similar: misp-galaxy:malpedia="WellMess" with estimative-language:likelihood-probability="likely"

Table 621. Table References

Links
https://blog.jpcert.or.jp/2018/07/malware-wellmes-9b78.html

Rosenbridge

The rosenbridge backdoor is a small, non-x86 core embedded alongside the main x86 core in the CPU. It is enabled by a model-specific-register control bit, and then toggled with a launch-instruction. The embedded core is then fed commands, wrapped in a specially formatted x86 instruction. The core executes these commands (which we call the 'deeply embedded instruction set'), bypassing all memory protections and privilege checks.

While the backdoor should require kernel level access to activate, it has been observed to be enabled by default on some systems, allowing any unprivileged code to modify the kernel.

The rosenbridge backdoor is entirely distinct from other publicly known coprocessors on x86 CPUs, such as the Management Engine or Platform Security Processor; it is more deeply embedded than any known coprocessor, having access to not only all of the CPU's memory, but its register file and execution pipeline as well.

The tag is: *misp-galaxy:backdoor="Rosenbridge"*

Table 622. Table References

ServHelper

The purpose of the macro was to download and execute a variant of ServHelper that set up reverse SSH tunnels that enabled access to the infected host through the Remote Desktop Protocol (RDP) port 3389.

"Once ServHelper establishes remote desktop access, the malware contains functionality for the threat actor to “hijack” legitimate user accounts or their web browser profiles and use them as they see fit," researchers from Proofpoint explain in an analysis released today.

The other ServHelper variant does not include the tunneling and hijacking capabilities and functions only as a downloader for the FlawedGrace RAT.

The tag is: *misp-galaxy:backdoor="ServHelper"*

Table 623. Table References

Links
https://www.bleepingcomputer.com/news/security/new-servhelper-backdoor-and-flawedgrace-rat-pushed-by-necurs-botnet/

Rising Sun

The Rising Sun backdoor uses the RC4 cipher to encrypt its configuration data and communications. As with most backdoors, on initial infection, Rising Sun will send data regarding the infected system to a command and control (C2) site. That information captures computer and user name, IP address, operating system version and network adapter information. Rising Sun contains 14 functions including executing commands, obtaining information on disk drives and running processes, terminating processes, obtaining file creation and last access times, reading and writing files, deleting files, altering file attributes, clearing the memory of processes and connecting to a specified IP address.

The tag is: *misp-galaxy:backdoor="Rising Sun"*

Table 624. Table References

Links
https://www.bluvector.io/threat-report-rising-sun-operation-sharpshooter/

SLUB

A new backdoor was observed using the Github Gist service and the Slack messaging system as communication channels with its masters, as well as targeting a very specific type of victim using a watering hole attack. The backdoor dubbed SLUB by the Trend Micro Cyber Safety Solutions Team who detected it in the wild is part of a multi-stage infection process designed by capable threat actors who programmed it in C++. SLUB uses statically-linked curl, boost, and JsonCpp libraries for performing HTTP request, "extracting commands from gist snippets," and "parsing Slack channel communication." The campaign recently observed by the Trend Micro security researchers abusing the Github and Slack uses a multi-stage infection process.

The tag is: *misp-galaxy:backdoor="SLUB"*

View relationships graph

SLUB has relationships with:

- similar: misp-galaxy:tool="SLUB Backdoor" with estimative-language:likelihood-probability="likely"

Table 625. Table References

Links
https://www.bleepingcomputer.com/news/security/new-slub-backdoor-uses-slack-github-as-communication-channels/

Asruex

Since it first emerged in 2015, Asruex has been known for its backdoor capabilities and connection to the spyware DarkHotel. However, when we encountered Asruex in a PDF file, we found that a variant of the malware can also act as an infector particularly through the use of old vulnerabilities CVE-2012-0158 and CVE-2010-2883, which inject code in Word and PDF files respectively.

The tag is: *misp-galaxy:backdoor="Asruex"*

Table 626. Table References

Speculoos

FreeBSD-based payload, Speculoos was delivered by exploiting CVE-2019-19781, a vulnerability affecting the Citrix Application Delivery Controller, Citrix Gateway, and Citrix SD-WAN WANOP appliances that allowed an adversary to remotely execute arbitrary commands. This vulnerability was first disclosed on December 17, 2019 via security bulletin CTX267679 which contained several mitigation recommendations. By January 24, 2020, permanent patches for the affected appliances were issued. Based on the spread of industries and regions, in addition to the timing of the vulnerability disclosure, we believe this campaign may have been more opportunistic in nature compared to the highly targeted attack campaigns that are often associated with these types of adversaries. However, considering the exploitation of the vulnerability in conjunction with delivery of a backdoor specifically designed to execute on the associated FreeBSD operating system indicates the adversary was absolutely targeting the affected devices.

The tag is: *misp-galaxy:backdoor="Speculoos"*

BazarBackdoor

Something that made the brute-force attacks on RDP connections easier was a new module of the notorious Trojan, TrickBot. It now seems that the TrickBot developers have a new tactic.

Cybersecurity researchers have discovered a new phishing campaign that delivers a stealthy backdoor called BazarBackdoor, which can be used to compromise and gain full access to corporate networks. As is the case with 91% of cyberattacks, this one starts with a phishing email. A range of subjects are used to personalize the emails: Customer complaints, coronavirus-themed payroll reports, or employee termination lists. All these emails contain links to documents hosted on Google Docs. To send the malicious emails, the cybercriminals use the marketing platform Sendgrid. This campaign uses spear phishing, which means that the perpetrators have made an effort to ensure that the websites sent in the emails seem legitimate and correspond to the emails subjects.

The tag is: *misp-galaxy:backdoor="BazarBackdoor"*

BazarBackdoor is also known as:

- BEERBOT
- KEGTAP
- Team9Backdoor
- bazaloader
- bazarloader
- bazaarloader

https://www.mandiant.com/resources/blog/investigating-ivanti-zero-day-exploitation

SPAWNSNAIL

SPAWNSNAIL is a backdoor that listens on localhost. It is designed to run by injecting into the dsmdm process (process responsible for supporting mobile device management features). It creates a backdoor by exposing a limited SSH server on localhost port 8300. We assess that the attacker uses the SPAWNMOLE tunneler to interact with SPAWNSNAIL.

SPAWNSNAIL's second purpose is to inject SPAWNSLOTH into dslogserver, a process supporting event logging on Connect Secure.

The tag is: *misp-galaxy:backdoor="SPAWNSNAIL"*

View relationships graph

SPAWNSNAIL has relationships with:

- used-by: misp-galaxy:threat-actor="UNC5337" with estimative-language:likelihood-probability="likely"
- preceded-by: misp-galaxy:tool="SPAWNANT" with estimative-language:likelihood-probability="likely"
- interacts-with: misp-galaxy:tool="SPAWNMOLE" with estimative-language:likelihood-probability="likely"
- injects: misp-galaxy:tool="SPAWNSLOTH" with estimative-language:likelihood-probability="likely"

IcedID

According to X-Force research, the new banking Trojan emerged in the wild in September 2017, when its first test campaigns were launched. Our researchers noted that IcedID has a modular malicious code with modern banking Trojan capabilities comparable to malware such as the Zeus Trojan. At this time, the malware targets banks, payment card providers, mobile services providers, payroll, webmail and e-commerce sites in the U.S. Two major banks in the U.K. are also on the target list the malware fetches.

The tag is: *misp-galaxy:banker="IcedID"*

downAndExec

Services like Netflix use content delivery networks (CDNs) to maximize bandwidth usage as it gives users greater speed when viewing the content, as the server is close to them and is part of the Netflix CDN. This results in faster loading times for series and movies, wherever you are in the world. But, apparently, the CDNs are starting to become a new way of spreading malware. The

attack chain is very extensive, and incorporates the execution of remote scripts (similar in some respects to the recent “fileless” banking malware trend), plus the use of CDNs for command and control (C&C), and other standard techniques for the execution and protection of malware.

The tag is: *misp-galaxy:banker="downAndExec"*

Smominru

Since the end of May 2017, we have been monitoring a Monero miner that spreads using the EternalBlue Exploit (CVE-2017-0144). The miner itself, known as Smominru (aka Ismo) has been well-documented, so we will not discuss its post-infection behavior. However, the miner’s use of Windows Management Infrastructure is unusual among coin mining malware. The speed at which mining operations conduct mathematical operations to unlock new units of cryptocurrency is referred to as “hash power”. Based on the hash power associated with the Monero payment address for this operation, it appeared that this botnet was likely twice the size of Adylkuzz. The operators had already mined approximately 8,900 Monero (valued this week between $2.8M and $3.6M). Each day, the botnet mined roughly 24 Monero, worth an average of $8,500 this week.

Kronos

Kronos was a type of banking malware first reported in 2014. It was sold for $7000. As of September 2015, a renew version was reconnecting with infected bots and sending them a brand new configuration file against U.K. banks and one bank in India. Similar to Zeus it was focused on stealing banking login credentials from browser sessions. A new version of this malware appears to have been used in 2018, the main difference is that the 2018 edition uses Tor-hosted C&C control panels.

The tag is: *misp-galaxy:banker="Kronos"*

Bhadra Framework

Bhadra Threat Modeling Framework.

Bhadra Framework is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Siddharth Prakash Rao - Silke Holtmanns - Tuomas Aura

Attacks from UE

"Attacks from UE" refers to any technique that involves the attacks launched by the software or hardware components of the user equipment to send malicious traffic into the mobile network.

The tag is: *misp-galaxy:bhadra-framework="Attacks from UE"*

SIM-based attacks

The "SIM-based attacks" are the techniques that involve any physical smart cards, namely SIM from 2G, USIM from 3G, and UICC from 4G networks.

The tag is: *misp-galaxy:bhadra-framework="SIM-based attacks"*

Attacks from radio access network

The "attacks from radio access network" are the techniques where an adversary with radio capabilities impersonates the mobile network to the UE (or vice versa) and becomes a man-in-the-middle.

The tag is: *misp-galaxy:bhadra-framework="Attacks from radio access network"*

Attacks from other mobile network

The "attacks from other mobile networks" and the "attacks with physical access to transport network" techniques can be conducted by evil mobile operators, law enforcement agencies for legal interception and human insiders with access to network nodes

The tag is: *misp-galaxy:bhadra-framework="Attacks from other mobile network"*

Attacks with access to transport network

The "attacks from other mobile networks" and the "attacks with physical access to transport network" techniques can be conducted by evil mobile operators, law enforcement agencies for legal interception and human insiders with access to network nodes

The tag is: *misp-galaxy:bhadra-framework="Attacks with access to transport network"*

Attacks from IP-based network

The "attacks from IP-based attacks" techniques mostly are launched from the service and application network, which allows non operator entities to infuse malicious tra□c into an operator's network.

The tag is: *misp-galaxy:bhadra-framework="Attacks from IP-based network"*

Insider attacks and human errors

The "insider attacks and human errors" technique involve the intentional attacks and unintentional mistakes from human insiders with access to any component of the mobile communication ecosystem.

The tag is: *misp-galaxy:bhadra-framework="Insider attacks and human errors"*

Infecting UE hardware or software

Retaining the foothold gained on the target system through the initial access by infecting UE hardware or software.

The tag is: *misp-galaxy:bhadra-framework="Infecting UE hardware or software"*

Infecting SIM cards

Retaining the foothold gained on the target system through the initial access by infecting SIM cards.

The tag is: *misp-galaxy:bhadra-framework="Infecting SIM cards"*

Spoofed radio network

Retaining the foothold gained on the target system through the initial access by radio network spoofing.

The tag is: *misp-galaxy:bhadra-framework="Spoofed radio network"*

Infecting network nodes

Retaining the foothold gained on the target system through the initial access by infecting network nodes.

The tag is: *misp-galaxy:bhadra-framework="Infecting network nodes"*

Covert channels

Retaining the foothold gained on the target system through the initial access via covert channels.

The tag is: *misp-galaxy:bhadra-framework="Covert channels"*

Port scanning or sweeping

"Port scanning or sweeping" techniques to probe servers or hosts with open ports.

The tag is: *misp-galaxy:bhadra-framework="Port scanning or sweeping"*

Perimeter mapping

"perimeter mapping" techniques such as command-line utilities (e.g., nmap and whois), web-based lookup tools and official APIs provided by the Internet registrars that assign the ASNs using a wide range of publicly available sources.

The tag is: *misp-galaxy:bhadra-framework="Perimeter mapping"*

Threat intelligence gathering

"Threat intelligence gathering" using dedicated search engines (such as Censys, Shodan) to gather information about vulnerable devices or networks, or using advanced search options of traditional search engines.

The tag is: *misp-galaxy:bhadra-framework="Threat intelligence gathering"*

CN-specific scanning

"CN-specific scanning", used to scan nodes that are interconnected with protocols specific to the mobile communication domain (GTP, SCTP).

The tag is: *misp-galaxy:bhadra-framework="CN-specific scanning"*

Internal resource search

"Internal resource search" refers to an insider with access to provider internal databases abusing the information as a discovery tactic.

The tag is: *misp-galaxy:bhadra-framework="Internal resource search"*

UE knocking

"UE knocking" refers to the technique that scans User Equipment, similarly to how IP endpoints and core network nodes are scanned or mapped.

The tag is: *misp-galaxy:bhadra-framework="UE knocking"*

Exploit roaming agreements

"Exploit roaming agreements" is a technique exploited by evil mobile operators. Despite communication with operators is dependent on a roaming agreement being in place, an attacker that has gained a foothold with one operator, it can abuse the roaming agreements in place for lateral movement with all adjacent operators with agreements in place.

The tag is: *misp-galaxy:bhadra-framework="Exploit roaming agreements"*

Abusing interworking functionalities

"Abusing Inter-working functionalities" is a technique for adversaries to move between networks of different generations laterally

The tag is: *misp-galaxy:bhadra-framework="Abusing interworking functionalities"*

Exploit platform & service-specific vulnerabilities

Once an attacker has gained a foothold in an operator, it can conduct privilege escalation and process injection for gaining administrative rights, password cracking of valid user accounts on the nodes, exploit vulnerabilities in databases and file systems, and take advantage of improper configurations of routers and switches.

The tag is: *misp-galaxy:bhadra-framework="Exploit platform & service-specific vulnerabilities"*

SS7-based-attacks

Attacks abusing the SS7 protocol.

The tag is: *misp-galaxy:bhadra-framework="SS7-based-attacks"*

Diameter-based attacks

Attacks abusing the Diameter protocol.

The tag is: *misp-galaxy:bhadra-framework="Diameter-based attacks"*

GTP-based attacks

Attacks abusing the GTP protocol.

The tag is: *misp-galaxy:bhadra-framework="GTP-based attacks"*

DNS-based attacks

DNS based attacks.

The tag is: *misp-galaxy:bhadra-framework="DNS-based attacks"*

Pre-AKA attacks

Attack techniques that take place during the unencrypted communication that occurs prior to the AKA protocol.

The tag is: *misp-galaxy:bhadra-framework="Pre-AKA attacks"*

Security audit camouflage

The operating systems, software, and services used on the network nodes are prone to security vulnerabilities and installation of unwanted malware. Although operators conduct routine security audits to track and patch the vulnerabilities or remove the malware from the infected nodes, their effectiveness is not known to the public. Any means by which an adversary can remain undetected from such audits are referred to as the security audit camouflage technique.

The tag is: *misp-galaxy:bhadra-framework="Security audit camouflage"*

Blacklist evasion

Mobile operators employ several defenses in terms of securing their network traffic. For instance, operators maintain a whitelist of IPs and GTs of nodes from their own infrastructure and their partner operators (as agreed in IR 21), and traffic from only these nodes are processed. Similarly, a blacklist is also maintained to control spam due to configuration errors and malicious traffic. Anything from the blacklist is banned from entering the operator's network. Such defense mechanisms may defend against unsolicited traffic from external networks (e.g., from the public Internet and SAN), but it barely serves its purpose in the case of attacks from inter-operator communications. Since most of the communication protocols are unauthenticated in nature, an a□acker with knowledge of identifiers of the allowed nodes (i.e. gained during the discovery phase) can impersonate their identity. We call it the blacklist evasion technique.

The tag is: *misp-galaxy:bhadra-framework="Blacklist evasion"*

Middlebox misconfiguration exploits

NAT middleboxes are used for separating private networks of mobile operators from public Internet works as the second line of defense. However, studies have shown that the middleboxes deployed by operators are prone to misconfigurations that allow adversaries to infiltrate malicious traffic into mobile networks e.g., by spoofing the IP headers. Some of the other NAT vulnerabilities lie in IPv4-to-IPv6 address mapping logic, which can be exploited by adversaries to exhaust the resources, wipe out the mapping, or to assist with blacklist evasion. Adversaries use such middlebox misconfiguration exploit techniques to launch denial-of-service or over-billing attacks.

The tag is: *misp-galaxy:bhadra-framework="Middlebox misconfiguration exploits"*

Bypass Firewall

Adversaries (e.g., evil operators) can for example exploit the implicit trust between roaming partners as a bypass firewall technique.

The tag is: *misp-galaxy:bhadra-framework="Bypass Firewall"*

Bypass homerouting

SMS home routing is a defense mechanism, where an additional SMS router intervenes in external location queries for SMS deliveries, and the roaming network takes the responsibility of delivering the SMS without providing location information to the external entity. Although many operators have implemented SMS home routing solutions, there are no silver bullets. If the SMS routers are incorrectly configured, adversaries can hide SMS delivery location queries within other messages so that the SMS home router fails to process them. We refer to it as the bypass home routing technique.

The tag is: *misp-galaxy:bhadra-framework="Bypass homerouting"*

Downgrading

Attacks on the radio access networks are well-studied and newer generations are designed to address the weaknesses in previous generations. Usage of weak cryptographic primitives, lack of integrity protection of the radio channels, and one-sided authentication (only from the network) remain as the problem of mostly GSM only radio communication. So, radio link attackers use downgrading as an attack technique to block service over newer generations and accept to serve only in the GSM radio network. The downgrading technique works similarly in the core network, where the adversary accepts to serve only in SS7-based signaling instead of Diameterbased signaling. Using interworking functions for inter-generation communication translation could make the downgrading attacks much easier.

The tag is: *misp-galaxy:bhadra-framework="Downgrading"*

Redirection

Redirection technique is a variant of the downgrading technique, where an adversary forcefully routes the traffic through networks or components that are under its control. By redirecting traffic to an unsafe network, the adversary can intercept mobile communication (e.g., calls and SMS) on the RAN part. Redirection attacks on the core network result in not only communication interception, but also in billing discrepancies, as an adversary can route the calls of a mobile user from its home network through a foreign network on a higher call rate.

The tag is: *misp-galaxy:bhadra-framework="Redirection"*

UE Protection evasion

Protection on the UE is mainly available in the form of antivirus apps as a defense against viruses and malware that steals sensitive information (e.g., banking credentials and user passwords) or track user activities. Simple visual cues on UE (such as notifications) could also be a protection mechanism by itself. Unfortunately, mobile network-based attacks cannot be detected or defended effectively from UE's side by traditional antivirus apps, and such attacks do not trigger any visual signs. Although there are attempts for defending against radio link attacks, including citywide studies to detect IMSI catchers, their effectiveness is still under debate. Similarly, there are recent attempts to detect signaling attacks using distance bounding protocol run from a UE. However, such solutions are still in the research phase, and their effectiveness on a large scale is still untested. To this end, the absence of robust detection and defense mechanisms on the UE is, in fact, an evasion mechanism for an adversary. We refer to them as UE protection evasion techniques.

The tag is: *misp-galaxy:bhadra-framework="UE Protection evasion"*

Admin credentials

Stealing legitimate admin credentials for critical nodes is beneficial for the adversary to increase its chances of persistence to the target or masquerade its activities.

The tag is: *misp-galaxy:bhadra-framework="Admin credentials"*

User-specific identifiers

User-specific identifiers such as IMSI and IMEI are an indicator for who owns UE with a specific subscription and where a UE is located physically. Since mobile users always keep their mobile phones physically near them, an adversary with the knowledge of these permanent identifiers will be able to determine whether or not a user is in a specific location. On the other hand, temporary identifiers (e.g., TMSI and GUTI) are used to reduce the usage of permanent identifiers like IMSI over radio channels. Although the temporary identifiers are supposed to change frequently and expected to live for a short period, research has shown that it is not the case

The tag is: *misp-galaxy:bhadra-framework="User-specific identifiers"*

User-specific data

Adversaries can collect several types of user-specific data, such as the content of SMS and calls, location dumps from base stations, call and billing records, and browsing-related data (such as DNS queries and unencrypted browsing sessions).

The tag is: *misp-galaxy:bhadra-framework="User-specific data"*

Network-specific identifiers

Adversaries aim to collect network-specific identifiers such as GTs and IPs of critical nodes and Tunnel Endpoint Identifier (TEID) of GTP tunnels from operators' networks

The tag is: *misp-galaxy:bhadra-framework="Network-specific identifiers"*

Network-specific data

Adversaries may also be interested in network-specific data that are obtained mainly during the execution of discovery tactics. Such data includes, e.g., the network topology, the trust relationship between different nodes, routing metadata, and sensitive documents

The tag is: *misp-galaxy:bhadra-framework="Network-specific data"*

Location tracking

Attacker is able to track the location of the target end-user.

The tag is: *misp-galaxy:bhadra-framework="Location tracking"*

Calls eavesdropping

Attacker is able to eavesdrop on calls.

The tag is: *misp-galaxy:bhadra-framework="Calls eavesdropping"*

SMS interception

Attacker is able to intercept SMS messages.

The tag is: *misp-galaxy:bhadra-framework="SMS interception"*

Data interception

Attacker is able to intercept or modify internet traffic.

The tag is: *misp-galaxy:bhadra-framework="Data interception"*

Billing frauds

Billing frauds refer to various types of attacks where an adversary causes financial discrepancies for operators.

The tag is: *misp-galaxy:bhadra-framework="Billing frauds"*

DoS - network

The attacker can create signaling havoc in specific nodes of operators by repeatedly triggering resource allocation or revocation requests.

The tag is: *misp-galaxy:bhadra-framework="DoS - network"*

DoS - user

The attacker can cause denial of service to mobile users.

The tag is: *misp-galaxy:bhadra-framework="DoS - user"*

Identity-related attacks

Identity-based attacks involve attack techniques using userand network-specific identifiers. Identity-based attacks cause harm to the privacy of mobile users and produce fraudulent traffic that incurs a financial loss to operators. In most cases, identity-based attacks are used in impersonation, where an adversary impersonates a legitimate mobile user to the core network without possessing appropriate credentials, for example, to avail free mobile services. Most of the signaling attacks that use SS7 are also fall into this category. In other cases, identitybased attacks involve identity mapping, where the adversaries map temporary identifiers (e.g., TMSI and GUTI) to permanent identifiers (e.g., IMSI or MSISDN). In rare cases, the IMSI can further be mapped to social media identities.

The tag is: *misp-galaxy:bhadra-framework="Identity-related attacks"*

Various

ADB.miner

A new botnet appeared over the weekend, and it's targeting Android devices by scanning for open debug ports so it can infect victims with malware that mines the Monero cryptocurrency.

The botnet came to life on Saturday, February 3, and is targeting port 5555, which on devices running the Android OS is the port used by the operating system's native Android Debug Bridge (ADB), a debugging interface that grants access to some of the operating system's most sensitive features.

Only devices running the Android OS have been infected until now, such as smartphones, smart TVs, and TV top boxes, according to security researchers from Qihoo 360's Network Security Research Lab [Netlab] division, the ones who discovered the botnet, which the named ADB.miner.

The tag is: *misp-galaxy:botnet="ADB.miner"*

Torpig

Torpig, also known as Anserin or Sinowal is a type of botnet spread through systems compromised by the Mebroot rootkit by a variety of trojan horses for the purpose of collecting sensitive personal and corporate data such as bank account and credit card information. It targets computers that use Microsoft Windows, recruiting a network of zombies for the botnet. Torpig circumvents antivirus software through the use of rootkit technology and scans the infected system for credentials, accounts and passwords as well as potentially allowing attackers full access to the computer. It is also purportedly capable of modifying data hajimeon the computer, and can perform man-in-the-browser attacks.

Storm

The Storm botnet or Storm worm botnet (also known as Dorf botnet and Ecard malware) is a remotely controlled network of "zombie" computers (or "botnet") that have been linked by the Storm Worm, a Trojan horse spread through e-mail spam. At its height in September 2007, the Storm botnet was running on anywhere from 1 million to 50 million computer systems, and accounted for 8% of all malware on Microsoft Windows computers. It was first identified around January 2007, having been distributed by email with subjects such as "230 dead as storm batters Europe," giving it its well-known name. The botnet began to decline in late 2007, and by mid-2008, had been reduced to infecting about 85,000 computers, far less than it had infected a year earlier.

Sality

Sality is the classification for a family of malicious software (malware), which infects files on Microsoft Windows systems. Sality was first discovered in 2003 and has advanced over the years to become a dynamic, enduring and full-featured form of malicious code. Systems infected with Sality may communicate over a peer-to-peer (P2P) network for the purpose of relaying spam, proxying of communications, exfiltrating sensitive data, compromising web servers and/or coordinating distributed computing tasks for the purpose of processing intensive tasks (e.g. password cracking). Since 2010, certain variants of Sality have also incorporated the use of rootkit functions as part of an ongoing evolution of the malware family. Because of its continued development and capabilities, Sality is considered to be one of the most complex and formidable forms of malware to date.

The tag is: *misp-galaxy:botnet="Sality"*

Sality is also known as:

- Sector
- Kuku
- Sality
- SalLoad
- Kookoo
- SaliCode

- Kukacka

https://en.wikipedia.org/wiki/Mariposa_botnet

Conficker

Conficker, also known as Downup, Downadup and Kido, is a computer worm targeting the Microsoft Windows operating system that was first detected in November 2008. It uses flaws in Windows OS software and dictionary attacks on administrator passwords to propagate while forming a botnet, and has been unusually difficult to counter because of its combined use of many advanced malware techniques. The Conficker worm infected millions of computers including government, business and home computers in over 190 countries, making it the largest known computer worm infection since the 2003 Welchia.

https://en.wikipedia.org/wiki/Waledac_botnet

Maazben

A new botnet, dubbed Maazben, has also been observed and is also growing rapidly. MessageLabs Intelligence has been tracking the growth of Maazben since its infancy in late May and early June. Its dominance in terms of the proportion of spam has been accelerating in the last 30 days from just over 0.5% of all spam, peaking at 4.5% of spam when it is most active. Currently spam from Maazben accounts for approximately 1.4% of all spam, but this is likely to increase significantly over time, particularly since both overall spam per minute sent and spam per bot per minute are increasing.

The tag is: *misp-galaxy:botnet="Maazben"*

Gheg

Tofsee, also known as Gheg, is another botnet analyzed by CERT Polska. Its main job is to send spam, but it is able to do other tasks as well. It is possible thanks to the modular design of this malware – it consists of the main binary (the one user downloads and infects with), which later downloads several additional modules from the C2 server – they modify code by overwriting some of the called functions with their own. An example of some actions these modules perform is spreading by posting click-bait messages on Facebook and VKontakte (Russian social network).

The tag is: *misp-galaxy:botnet="Gheg"*

Zeus

Zeus, ZeuS, or Zbot is a Trojan horse malware package that runs on versions of Microsoft Windows. While it can be used to carry out many malicious and criminal tasks, it is often used to steal banking information by man-in-the-browser keystroke logging and form grabbing. It is also used to install the CryptoLocker ransomware. Zeus is spread mainly through drive-by downloads and phishing schemes. First identified in July 2007 when it was used to steal information from the United States Department of Transportation, it became more widespread in March 2009. In June 2009 security company Prevx discovered that Zeus had compromised over 74,000 FTP accounts on websites of such companies as the Bank of America, NASA, Monster.com, ABC, Oracle, Play.com, Cisco, Amazon, and BusinessWeek. Similarly to Koobface, Zeus has also been used to trick victims of tech support scams into giving the scam artists money through pop-up messages that claim the user has a virus, when in reality they might have no viruses at all. The scammers may use programs such as Command prompt or Event viewer to make the user believe that their computer is infected.

Chameleon

The Chameleon botnet is a botnet that was discovered on February 28, 2013 by the security research firm, spider.io. It involved the infection of more than 120,000 computers and generated, on average, 6 million US dollars per month from advertising traffic. This traffic was generated on infected systems and looked to advertising parties as regular end users which browsed the Web, because of which it was seen as legitimate web traffic. The affected computers were all Windows PCs with the majority being private PCs (residential systems).

Mirai

Mirai (Japanese for "the future", □□) is a malware that turns networked devices running Linux into remotely controlled "bots" that can be used as part of a botnet in large-scale network attacks. It primarily targets online consumer devices such as IP cameras and home routers. The Mirai botnet was first found in August 2016 by MalwareMustDie, a whitehat malware research group, and has been used in some of the largest and most disruptive distributed denial of service (DDoS) attacks, including an attack on 20 September 2016 on computer security journalist Brian Krebs's web site, an attack on French web host OVH, and the October 2016 Dyn cyberattack.

Satori

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants.Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot.The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869.Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: *misp-galaxy:botnet="Satori"*

Hajime

Hajime (meaning 'beginning' in Japanese) is an IoT worm that was first mentioned on 16 October 2016 in a public report by RapidityNetworks. One month later we saw the first samples being uploaded from Spain to VT. This worm builds a huge P2P botnet (almost 300,000 devices at the time of publishing this blogpost), but its real purpose remains unknown. It is worth mentioning that in the past, the Hajime IoT botnet was never used for massive DDoS attacks, and its existance was a mystery for many researchers, as the botnet only gathered infected devices but almost never did anything with them (except scan for other vulnerable devices).

The tag is: *misp-galaxy:botnet="Hajime"*

Muhstik

The botnet is exploiting the CVE-2018-7600 vulnerability —also known as Drupalgeddon 2— to access a specific URL and gain the ability to execute commands on a server running the Drupal

CMS. At the technical level, Netlab says Muhstik is built on top of Tsunami, a very old strain of malware that has been used for years to create botnets by infecting Linux servers and smart devices running Linux-based firmware. Crooks have used Tsunami initially for DDoS attacks, but its feature-set has greatly expanded after its source code leaked online. The Muhstik version of Tsunami, according to a Netlab report published today, can launch DDoS attacks, install the XMRig Monero miner, or install the CGMiner to mine Dash cryptocurrency on infected hosts. Muhstik operators are using these three payloads to make money via the infected hosts.

The tag is: *misp-galaxy:botnet="Muhstik"*

Hide and Seek

Security researchers have discovered the first IoT botnet malware strain that can survive device reboots and remain on infected devices after the initial compromise. This is a major game-changing moment in the realm of IoT and router malware. Until today, equipment owners could always remove IoT malware from their smart devices, modems, and routers by resetting the device. The reset operation flushed the device's flash memory, where the device would keep all its working data, including IoT malware strains. But today, Bitdefender researchers announced they found an IoT malware strain that under certain circumstances copies itself to /etc/init.d/, a folder that houses daemon scripts on Linux-based operating systems —like the ones on routers and IoT devices. By placing itself in this menu, the device's OS will automatically start the malware's process after the next reboot.

Chalubo

Since early September, SophosLabs has been monitoring an increasingly prolific attack targeting Internet-facing SSH servers on Linux-based systems that has been dropping a newly-discovered family of denial-of-service bots we're calling Chalubo. The attackers encrypt both the main bot component and its corresponding Lua script using the ChaCha stream cipher. This adoption of anti-analysis techniques demonstrates an evolution in Linux malware, as the authors have adopted principles more common to Windows malware in an effort to thwart detection. Like some of its predecessors, Chalubo incorporates code from the Xor.DDoS and Mirai malware families.

EnemyBot

In mid-March [2022], FortiGuard Labs observed a new DDoS botnet calling itself “Enemybot” and attributing itself to Keksec, a threat group that specializes in cryptomining and DDoS attacks.

This botnet is mainly derived from Gafgyt’s source code but has been observed to borrow several modules from Mirai’s original source code.

It uses several methods of obfuscation for its strings to hinder analysis and hide itself from other botnets. Furthermore, it connects to a command-and-control (C2) server that is hidden in the Tor network, making its takedown more complicated.

Enemybot has been seen targeting routers from Seowon Intech, D-Link, and exploits a recently reported iRZ router vulnerability to infect more devices.

KmsdBot

Akamai Security Research has observed a new golang malware which they named KmsdBot. The malware scans for open SSH ports and performs a simple dictionary attack against it. The researchers from Akamai monitored only DDoS activity, but discovered also the functionality to launch cryptomining. The malware has varied targets including the gaming industry, technology industry, and luxury car manufacturers.

The tag is: *misp-galaxy:botnet="KmsdBot"*

Table 773. Table References

HinataBot

Akamai researchers on the Security Intelligence Response Team (SIRT) have discovered a new Go-based, DDoS-focused botnet. The malware appears to have been named “Hinata” by the malware author after a character from the popular anime series, Naruto. We are calling it “HinataBot.” Looks like an attempt to rewrite Mirai in Go. The threat actors behind HinataBot originally distributed Mirai binaries.

The tag is: *misp-galaxy:botnet="HinataBot"*

View relationships graph

HinataBot has relationships with:

- similar: misp-galaxy:botnet="Mirai" with estimative-language:likelihood-probability="likely"

3ve

3ve, pronounced as “Eve”, was a botnet that was halted in late 2018. 3ve utilized the malware packages Boaxxe and Kovter to infect a network of PCs. They were spread through emails and fake downloads, and once infected, the bots would generate fake clicks on online advertisements. The clicks would be used on fake websites, which hosted ads and then absorbed the ad revenue from the false impressions. Bots were able to mimic desktop and mobile traffic in order to evade detection, and went through several evolutions of tactics to grow over time. At its peak, the botnet controlled more than one million residential and corporate IP-addresses, largely within Europe and North America.

The tag is: *misp-galaxy:botnet="3ve"*

Table 775. Table References

https://en.wikipedia.org/wiki/3ve

7777-Botnet

7777-Botnet has been observed brute forcing Microsoft Azure instances via Microsoft Azure PowerShell bruteforcing. The botnet has a unique pattern of opening port 7777 on infected devices, returning an “xlogin:” message. The botnet has been used for low-volume attacks against targets of all industry sectors at a global scale, almost exclusively targeting C-Level employee logins. Due to the very low volume of around 2–3 login requests per week, the botnet is able to evade most security solutions.

The tag is: *misp-galaxy:botnet="7777-Botnet"*

Table 776. Table References

Links
https://gi7w0rm.medium.com/the-curious-case-of-the-7777-botnet-86e3464c3ffd

Amadey

Amadey is a botnet that appeared around October 2018 and is being sold for about $500 on Russian-speaking hacking forums. It periodically sends information about the system and installed AV software to its C2 server and polls to receive orders from it. Its main functionality is that it can load other payloads (called tasks) for all or specifically targeted computers compromised by the malware.

The tag is: *misp-galaxy:botnet="Amadey"*

Table 777. Table References

Avalanche

Avalanche refers to a large global network hosting infrastructure used by cyber criminals to conduct phishing and malware distribution campaigns and money mule schemes. is a set of computer programs to conduct a DDoS attack. It is believed that trinoo networks have been set up on thousands of systems on the Internet that have been compromised by remote buffer overrun exploits. Cyber criminals utilized Avalanche botnet infrastructure to host and distribute a variety of malware variants to victims, including the targeting of over 40 major financial institutions. Victims may have had their sensitive personal information stolen (e.g., user account credentials). Victims' compromised systems may also have been used to conduct other malicious activity, such as launching denial-of-service (DoS) attacks or distributing malware variants to other victims' computers. In addition, Avalanche infrastructure was used to run money mule schemes where criminals recruited people to commit fraud involving transporting and laundering stolen money or merchandise. Avalanche used fast-flux DNS, a technique to hide the criminal servers, behind a constantly changing network of compromised systems acting as proxies.

The tag is: *misp-galaxy:botnet="Avalanche"*

Cooee

Cooee is a trojan pre-installed on some Phillips smartphones that displays annoying advertisements and downloads and installs different software without user knowledge.

The tag is: *misp-galaxy:botnet="Cooee"*

Table 788. Table References

Links
https://news.softpedia.com/news/trojan-found-preinstalled-on-the-firmware-of-some-phillips-s307-android-smartphones-499177.shtml

Coreflood

Coreflood is a trojan horse and botnet created by a group of Russian hackers and released in 2010. The FBI included on its list of infected systems approximately 17 state or local government agencies, including one police department; three airports; two defense contractors; five banks or financial institutions; approximately 30 colleges or universities; approximately 20 hospital or health care companies; and hundreds of businesses. It is present on more than 2.3 million computers worldwide and as of May 2011 remains a threat.

The tag is: *misp-galaxy:botnet="Coreflood"*

Table 789. Table References

Links
https://en.wikipedia.org/wiki/Coreflood

Crackonosh

In 2021 Crackonosh has been found in 222,000 compromised computers that were used to download illegal, torrented versions of popular video games. Crackonosh successfully operated for years because it had built-in mechanisms to disable security software and updates, which made it difficult for users to detect and remove the program. The malware is thought to have originated in the Czech Republic, but it had a global reach.

The tag is: *misp-galaxy:botnet="Crackonosh"*

Great Cannon

The Great Cannon of China is an Internet attack tool that is used by the Chinese government to launch distributed denial-of-service attacks on websites by performing a man-in-the-middle attack on large amounts of web traffic and injecting code which causes the end-user's web browsers to flood traffic to targeted websites.[1] According to the researchers at the Citizen Lab, the

International Computer Science Institute, and Princeton University's Center for Information Technology Policy, who coined the term, the Great Cannon hijacks foreign web traffic intended for Chinese websites and re-purposes them to flood targeted web servers with enormous amounts of traffic in an attempt to disrupt their operations.

The tag is: *misp-galaxy:botnet="Great Cannon"*

Table 794. Table References

Links
https://en.wikipedia.org/wiki/Great_Cannon

Hail Mary Cloud

The Hail Mary Cloud was, or is, a password guessing botnet, which used a statistical equivalent to brute force password guessing. The botnet ran from possibly as early as 2005, and certainly from 2007 until 2012 and possibly later. The botnet was named and documented by Peter N. M. Hansteen. The principle is that a botnet can try several thousands of more likely passwords against thousands of hosts, rather than millions of passwords against one host. Since the attacks were widely distributed, the frequency on a given server was low and was unlikely to trigger alarms. Moreover, the attacks come from different members of the botnet, thus decreasing the effectiveness of both IP based detection and blocking.

The tag is: *misp-galaxy:botnet="Hail Mary Cloud"*

Table 795. Table References

Links
https://en.wikipedia.org/wiki/Hail_Mary_Cloud

Joker

Joker is a trojan that is included in several unsuspecting apps that have been offered via the Google Play Store, among others. The malware silently interacts with ad networks to perform clicks on ad banners and subscribe to paid premium services. To do this, Joker is able to read SMS messages, contact lists and device information from the victim system. It collects data from infected systems, intercepts sensitive communications and transmits the information to a remote attacker.

The tag is: *misp-galaxy:botnet="Joker"*

Table 796. Table References

KBOT

KBOT penetrates users' computers via the Internet or a local network, or from infected external media. After the infected file is launched, the malware gains a foothold in the system, writing itself to Startup and the Task Scheduler, and then deploys web injects to try to steal the victim's bank and personal data. For the same purpose, KBOT can download additional stealer modules that harvest and send to the C&C server almost full information about the user: passwords/logins, cryptowallet data, lists of files and installed applications, and so on.

The tag is: *misp-galaxy:botnet="KBOT"*

Linux.Darlloz

Linux.Darlloz is a worm which infects Linux embedded systems. Linux.Darlloz was first discovered by Symantec in 2013.[3] Linux.Darlloz targets the Internet of things and infects routers, security cameras, set-top boxes by exploiting a PHP vulnerability. The worm was based on a Proof of concept code that was released in October 2013. inux.Darlloz utilizes vulnerability (CVE-2012-1823) to exploit systems in order to compromise systems. Linux.Darlloz was later found in March 2014 to have started mining crypto currencies such as Mincoin and Dogecoin. Linux.Aidra, the malware that Linux.Darlloz attempts usurp - like some of the variants of Darlloz, Linux.Aidra targets smaller devices, specifically cable and DSL modems. The worm adds them to a botnet, which can be utilized by the attackers to perform DDoS attacks.

https://threatpost.com/matsnu-botnet-dga-discovers-power-of-words/109426/

Methbot

Methbot was an advertising fraud scheme. Methbot was first tracked in 2015 by cybersecurity firm White Ops, and the botnet saw rapidly increased activity in 2016. The botnet originated in Russia (though it was not state sponsored), and utilized foreign computers and networks in Europe and North America. The infrastructure consisted of 571,904 dedicated IPs, 6,000 domains, and 250,267 distinct URLs, each of which could only house a video ad, and used variants of the names of famous publishers to fool those looking into the domains. This led the operators to game the system, leading ad selection algorithms to select these fake web pages over larger corporate pages from legitimate companies, and charge advertisers at a premium. About 570,000 bots were used to execute clicks on those websites, “watching” up to 300 million video ads a day while the bots mimicked normal computer user behavior. Estimated clicks per day generally reached between 200 and 300 million per day. The botnet relied on data servers instead of more traditional botnets that rely on infected PCs and mobile devices.

The tag is: *misp-galaxy:botnet="Methbot"*

Table 801. Table References

Links
https://en.wikipedia.org/wiki/Methbot

Metulji

The Metulji botnet, discovered in June 2011, is a botnet mainly involved in cyberscamming and denial of service attacks. Before the botnet itself was dismantled, it consisted of over 12 million individual zombie computers infected with the Butterfly Bot, making it, as of June 2011, the largest known botnet. It is not known what type of computers are vulnerable, or how to tell if a computer is a part of this botnet.

The tag is: *misp-galaxy:botnet="Metulji"*

Table 802. Table References

Necurs

The Necurs botnet is a distributor of many pieces of malware, most notably Locky. Around June 1, 2016, the botnet went offline, perhaps due to a glitch in the command and control server running Necurs. However, three weeks later, Jon French from AppRiver discovered a spike in spam emails, signifying either a temporary spike in the botnet's activity or return to its normal pre-June 1 state. In a 2020 report, it was noted to have particularly targeted India, Southeast Asia, Turkey and Mexico.

The tag is: *misp-galaxy:botnet="Necurs"*

Table 807. Table References

Links
https://en.wikipedia.org/wiki/Necurs_botnet

Nitol

The Nitol botnet mostly involved in spreading malware and distributed denial-of-service attacks. The Nitol Botnet was first discovered around December 2012, with analysis of the botnet indicating that the botnet is mostly prevalent in China where an estimate 85% of the infections are detected. In China the botnet was found to be present on systems that came brand-new from the factory, indicating the trojan was installed somewhere during the assembly and manufacturing process. According to Microsoft the systems at risk also contained a counterfeit installation of Microsoft Windows. On 10 September 2012 Microsoft took action against the Nitol Botnet by obtaining a court order and subsequently sinkholing the 3322.org domain. The 3322.org domain is a Dynamic DNS which was used by the botnet creators as a command and control infrastructure for controlling their botnet. Microsoft later settled with 3322.org operator Pen Yong, which allowed the latter to continue operating the domain on the condition that any subdomains linked to malware remain sinkholed.

The tag is: *misp-galaxy:botnet="Nitol"*

Table 808. Table References

Links
https://en.wikipedia.org/wiki/Nitol_botnet

Nymaim

Nymaim was discovered in 2013. At that time it was only a dropper used to distribute TorrentLocker. In February 2016 it became popular again after incorporating leaked ISFB code, dubbed Goznym. When dropper obtains C&C address, it starts real communication. It downloads two important binaries and a lot more: payload – banker module (responsible for web injects – passive member of botnet); optional bot module (it is trying to open ports on a router and become an active part of a botnet. When it fails to do so, it removes itself from a system).

The tag is: *misp-galaxy:botnet="Nymaim"*

Table 809. Table References

Pushlran

Pushlran is a potentially unwanted application (PUA) for Android devices. It displays additional pop-ups and advertisements when the device is used. The app collects data from infected systems, intercepts sensitive communication and passes this information to a remote attacker.

The tag is: *misp-galaxy:botnet="Pushlran"*

Pykspa

Pykspa is a piece of malware that can be used to remotely control infected systems. It also enables attackers to download other malware or extract personal data. There are a number of versions of this malware and it has been developed over a long period of time. Some of the most recent versions of Pykspa are able to deactivate security systems such as anti-virus programs.

The tag is: *misp-galaxy:botnet="Pykspa"*

Table 816. Table References

Links

Qsnatch

Qsnatch is a trojan for Linux devices that primarily attacks network drives manufactured by QNAP. Its functions include stealing access data and opening backdoors to infected devices. Through this backdoor, the attacker can gain access to the system and perform other actions. The malware is capable of a wide range of attack types, from information theft to downloading other malware.

The tag is: *misp-galaxy:botnet="Qsnatch"*

Table 817. Table References

Remaiten

Remaiten is malware which infects Linux on embedded systems by brute forcing using frequently used default username and passwords combinations from a list in order to infect a system. Remaiten combines the features of the Tsunami and LizardStresser (aka Torlus) malware families. The command and control for Remaiten are handled by IRC communications. Additionally the command and control is done by an actual IRC channel rather than only the IRC protocol. This is an improvement over bots such as Tsunami and Torlus making Remaiten a greater threat than both combined. To avoid detection, Remaiten tries to determine the platform of a device to download the architecture-appropriate component from the command & control server. Once Remaiten infects a device it is able to perform actions such as launching distributed denial of service attacks or download more malware on a device.[5] Remaiten is able to scan and remove competing bots on a system compromised by it.

The tag is: *misp-galaxy:botnet="Remaiten"*

Table 818. Table References

Links
https://en.wikipedia.org/wiki/Remaiten

Retadup

Retadup is a worm affecting Windows machines primarily throughout Latin America. Its objective is to achieve persistence on its victims' computers, to spread itself far and wide and to install additional malware payloads on infected machines. In the vast majority of cases, the installed payload is a piece of malware mining cryptocurrency on the malware authors' behalf. The French law enforcement agency, National Gendarmerie, in 2019 announced the successful takedown of one of the largest wide-spread RETADUP botnet malware and how it remotely disinfected more than 850,000 computers worldwide with the help of researchers.

The tag is: *misp-galaxy:botnet="Retadup"*

RootSTV

RootSTV is a trojan and downloader for Android devices, mainly SmartTVs. RootSTV downloads additional malicious programs from a server and executes them without the user's consent.

The tag is: *misp-galaxy:botnet="RootSTV"*

Table 820. Table References

Links
https://www.bsi.bund.de/EN/Themen/Verbraucherinnen-und-Verbraucher/Cyber-Sicherheitslage/Methoden-der-Cyber-Kriminalitaet/Botnetze/Steckbriefe-aktueller-Botnetze/steckbriefe-aktueller-botnetze_node.html

Rovnix

Rovnix is a data-stealing trojan that spreads by email and infects Windows PCs. Initial versions of the malware featured the extraction of data from compromised machines using unencrypted comms but more recently this has evolved to feature encryption during broadcast. The malware spread via e-mails infected with the Andromeda downloader. The infected attachment gets executed by an unwary user and this in turn downloads and runs Rovnix. The whole attack is designed to steal financial information, mainly credit card numbers. A new cluster of infections by the Rovnix Trojan has infected more than 130,000 Windows computers in the UK alone.

The tag is: *misp-galaxy:botnet="Rovnix"*

Table 821. Table References

Links

https://www.theregister.com/2014/11/06/rovnix_trojan_outbreak/

Slenfbot

Slenfbot was first discovered in 2007 and, since then, numerous variants have followed; each with slightly different characteristics and new additions to the worm's payload, such as the ability to provide the attacker with unauthorized access to the compromised host. Slenfbot primarily spreads by luring users to follow links to websites, which contain a malicious payload. Slenfbot propagates via instant messaging applications, removable drives and/or the local network via network shares. The code for Slenfbot appears to be closely managed, which may provide attribution to a single group and/or indicate that a large portion of the code is shared amongst multiple groups. The inclusion of other malware families and variants as well as its own continuous evolution, makes Slenfbot a highly effective downloader with a propensity to cause even more damage to compromised systems.

The tag is: *misp-galaxy:botnet="Slenfbot"*

Table 822. Table References

Links
https://en.wikipedia.org/wiki/Slenfbot

Stacheldraht

Stacheldraht is malware which performs a distributed denial-of-service (DDoS) attack. Stacheldraht uses a number of different denial-of-service (DoS) attack methods, including Ping flood, UDP flood, TCP SYN flood, and Smurf attack. Further, it can detect and automatically enable source address forgery. Adding encryption, it combines features of Trinoo and of Tribe Flood Network. The software runs on both Linux and Solaris.

The tag is: *misp-galaxy:botnet="Stacheldraht"*

Table 823. Table References

Links
https://en.wikipedia.org/wiki/Stacheldraht

Suppobox

Suppobox is a trojan that intercepts any network traffic connected with a monetary transaction when users buy or sell products online. The malware focuses on auction websites.

The tag is: *misp-galaxy:botnet="Suppobox"*

Suppobox is also known as:

- Bayrob
- Nivdort

Table 824. Table References

Links
https://www.bsi.bund.de/EN/Themen/Verbraucherinnen-und-Verbraucher/Cyber-Sicherheitslage/Methoden-der-Cyber-Kriminalitaet/Botnetze/Steckbriefe-aktueller-Botnetze/steckbriefe-aktueller-botnetze.html

Triada

Triada is a trojan for Android devices. Triada's primary function is to record text messages. For example, it intercepts in-app purchases via text message and redirects payments made. Triada downloads other malware from a server and runs these programs.

The tag is: *misp-galaxy:botnet="Triada"*

Triada is also known as:

- APK. Triada

Zemra

Zemra is a DDoS Bot which was first discovered in underground forums in May 2012. Zemra is capable of HTTP and SYN Flood flooding and also has a simple Command & Control panel that is protected with 256-bit DES encryption for communicating with its command and control (C&C) server. Zemra also sends information such as Computer name, Language settings, and Windows

version. It will send this data to a remote location on a specific date and time. It also opens a backdoor on TCP port 7710 to receive commands from a remote command-and-control server, and it is able to monitor devices, collect system information, execute files, and even update or uninstall itself if necessary.

The tag is: *misp-galaxy:botnet="Zemra"*

Table 827. Table References

Branded Vulnerability

List of known vulnerabilities and attacks with a branding.

Branded Vulnerability is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Unknown

Meltdown

Meltdown exploits the out-of-order execution feature of modern processors, allowing user-level programs to access kernel memory using processor caches as covert side channels. This is specific to the way out-of-order execution is implemented in the processors. This vulnerability has been assigned CVE-2017-5754.

The tag is: *misp-galaxy:branded-vulnerability="Meltdown"*

Spectre

Spectre exploits the speculative execution feature that is present in almost all processors in existence today. Two variants of Spectre are known and seem to depend on what is used to influence erroneous speculative execution. The first variant triggers speculative execution by performing a bounds check bypass and has been assigned CVE-2017-5753. The second variant uses branch target injection for the same effect and has been assigned CVE-2017-5715.

The tag is: *misp-galaxy:branded-vulnerability="Spectre"*

Heartbleed

Heartbleed is a security bug in the OpenSSL cryptography library, which is a widely used implementation of the Transport Layer Security (TLS) protocol. It was introduced into the software in 2012 and publicly disclosed in April 2014. Heartbleed may be exploited regardless of whether the vulnerable OpenSSL instance is running as a TLS server or client. It results from improper input validation (due to a missing bounds check) in the implementation of the TLS heartbeat extension, thus the bug's name derives from heartbeat. The vulnerability is classified as a buffer over-read,[5] a situation where more data can be read than should be allowed.

The tag is: *misp-galaxy:branded-vulnerability="Heartbleed"*

Shellshock

Shellshock, also known as Bashdoor, is a family of security bugs in the widely used Unix Bash shell, the first of which was disclosed on 24 September 2014. Many Internet-facing services, such as some web server deployments, use Bash to process certain requests, allowing an attacker to cause vulnerable versions of Bash to execute arbitrary commands. This can allow an attacker to gain unauthorized access to a computer system.

The tag is: *misp-galaxy:branded-vulnerability="Shellshock"*

Ghost

The GHOST vulnerability is a serious weakness in the Linux glibc library. It allows attackers to remotely take complete control of the victim system without having any prior knowledge of system credentials. CVE-2015-0235 has been assigned to this issue. During a code audit Qualys researchers discovered a buffer overflow in the __nss_hostname_digits_dots() function of glibc. This bug can be triggered both locally and remotely via all the gethostbyname*() functions. Applications have access to the DNS resolver primarily through the gethostbyname*() set of functions. These functions convert a hostname into an IP address.

The tag is: *misp-galaxy:branded-vulnerability="Ghost"*

Stagefright

Stagefright is the name given to a group of software bugs that affect versions 2.2 ("Froyo") and

newer of the Android operating system. The name is taken from the affected library, which among other things, is used to unpack MMS messages. Exploitation of the bug allows an attacker to perform arbitrary operations on the victim's device through remote code execution and privilege escalation. Security researchers demonstrate the bugs with a proof of concept that sends specially crafted MMS messages to the victim device and in most cases requires no end-user actions upon message reception to succeed—the user doesn't have to do anything to 'accept' the bug, it happens in the background. The phone number is the only target information.

The tag is: *misp-galaxy:branded-vulnerability="Stagefright"*

Badlock

Badlock is a security bug disclosed on April 12, 2016 affecting the Security Account Manager (SAM) and Local Security Authority (Domain Policy) (LSAD) remote protocols[1] supported by Windows and Samba servers.

The tag is: *misp-galaxy:branded-vulnerability="Badlock"*

Dirty COW

Dirty COW (Dirty copy-on-write) is a computer security vulnerability for the Linux kernel that affects all Linux-based operating systems including Android. It is a local privilege escalation bug that exploits a race condition in the implementation of the copy-on-write mechanism in the kernel's memory-management subsystem. The vulnerability was discovered by Phil Oester. Because of the race condition, with the right timing, a local attacker can exploit the copy-on-write mechanism to turn a read-only mapping of a file into a writable mapping. Although it is a local privilege escalation, remote attackers can use it in conjunction with other exploits that allow remote execution of non-privileged code to achieve remote root access on a computer. The attack itself does not leave traces in the system log.

The tag is: *misp-galaxy:branded-vulnerability="Dirty COW"*

POODLE

The POODLE attack (which stands for "Padding Oracle On Downgraded Legacy Encryptio") is a man-in-the-middle exploit which takes advantage of Internet and security software clients' fallback to SSL 3.0. If attackers successfully exploit this vulnerability, on average, they only need to make 256 SSL 3.0 requests to reveal one byte of encrypted messages. Bodo Möller, Thai Duong and Krzysztof Kotowicz from the Google Security Team discovered this vulnerability; they disclosed the vulnerability publicly on October 14, 2014 (despite the paper being dated "September 2014"). Ivan Ristic does not consider the POODLE attack as serious as the Heartbleed and Shellshock attacks. On December 8, 2014 a variation of the POODLE vulnerability that affected TLS was announced.

The tag is: *misp-galaxy:branded-vulnerability="POODLE"*

BadUSB

The ‘BadUSB’ vulnerability exploits unprotected firmware in order to deliver malicious code to computers and networks. This is achieved by reverse-engineering the device and reprogramming it. As the reprogrammed firmware is not monitored or assessed by modern security software, this attack method is extremely difficult for antivirus/security software to detect and prevent.

The tag is: *misp-galaxy:branded-vulnerability="BadUSB"*

ImageTragick

The tag is: *misp-galaxy:branded-vulnerability="ImageTragick"*

Blacknurse

Blacknurse is a low bandwidth DDoS attack involving ICMP Type 3 Code 3 packets causing high CPU loads first discovered in November 2016. The earliest samples we have seen supporting this DDoS method are from September 2017.

The tag is: *misp-galaxy:branded-vulnerability="Blacknurse"*

SPOILER

SPOILER is a security vulnerability on modern computer central processing units that uses speculative execution to improve the efficiency of Rowhammer and other related memory and cache attacks. According to reports, all modern Intel CPUs are vulnerable to the attack. AMD has stated that its processors are not vulnerable.

The tag is: *misp-galaxy:branded-vulnerability="SPOILER"*

Australian Strategic Policy Institute

Academy of Military Science (□□□□□□□□□□□□)

AMS is responsible for leading and coordinating military science for the whole military. AMS is involved in not only the development of theory, strategy, and doctrine but also advancing national defense innovation. Pursuant to the PLA reforms, AMS has undergone dramatic changes starting in June 2017. At a July 2017 ceremony marking the AMS's reorganisation, Xi urged the AMS to construct a 'world-class military scientific research institution.' Through the National Defence Science and Technology Innovation Institute, the AMS is pursuing research in cutting-edge technologies including unmanned systems, artificial intelligence, biotechnology and quantum technology.

Aero Engine Corporation of China (□□□□□□□□□□□□□)

AECC is a leading producer of aircraft parts for the People's Liberation Army (PLA), having separated from its parent company the Aviation Industry Corporation of China (AVIC) in 2016. The company reports having 27 affiliated or subordinate companies, three major listed companies, and 84,000 staff. AVIC and the Commercial Aircraft Corporation of China (also known as COMAC) are major shareholders in AECC.AECC's main products include aircraft engines, combustion gas turbines, and transmission systems. AECC also develops aircraft power units, helicopter drive systems, monocrystalline blades, turbine disks, and graphene.AECC was established in order to improve China's capability in developing domestically built aircraft engines as part of the 'Made in China 2025' program. A priority is strengthening its supply chains within China. Though

indigenously developed engines have proven challenging for AECC, the company had purported success in providing thrust vector control technology for the J-10B fighter jet.

Air Force Command College (□□□□□□□□□□□□□□)

The PLA Air Force Command College in Beijing is considered the PLA Air Force's 'peak institution for educating mid-rank and senior officers' for command posts across the service. The college has a long history and was initially established in Nanjing during the early years of the People's Republic in 1958.The Air Force Command College offers a range of degree programmes, mainly at the postgraduate level, including training in military disciplines such as military history, strategy, and tactics. It has published research on control science and radar. The college's other specialties include battlefield command, military operations as well as political–ideological education.

Air Force Engineering University (□□□□□□□□□□□□□□)

The Air Force Engineering University (AFEU) is one of the PLA’s five comprehensive universities alongside NUDT, Naval Engineering University, PLA Information Engineering University and Army Engineering University. It trains students in a variety of engineering and military disciplines related to air combat.AFEU currently has around 8,000 students, including 1,600 postgraduate students. Its priority areas include technical studies in information and communication systems engineering as well as in social sciences such as in professional military training. Research into unmanned aerial vehicle technology is another important area of research at the university. In 2017, China’s Ministry of Education ranked AFEU equal fourth for armament science out of nine universities, only awarding it a B- grade for the discipline.Colleges under AFEU include:

Air Force Medical University (□□□□□□□□□□□□□□)

The Air Force Medical University, also known as the Fourth Military Medical University, is the PLA’s premier institution for research into medical and psychological sciences, having been placed under command of the Air Force after Xi Jinping’s military reforms in 2017. Its major areas of study are medical and psychological sciences tailored for personnel engaging in air and space operations, military preventative medicine and various other forms of clinical research.The Air Force Medical University conducts significant amounts of psychological research. Scientists from the Air Force Medical University have written studies on suicide, mental health across China, and mental health in military universities. The university’s scientists have also looked at the extent to which mindfulness training can reduce anxiety for undergraduates at military universities, and at how fear induced by virtual combat scenarios impacts decision-making. This indicates that the university is interested in issues of troop morale and decision-making in high-stress situations.

Army Academy of Armored Forces (□□□□□□□□□□□□□□□)

The Army Academy of the Armored Forces is China's lead institute responsible for training and research for armoured combat. This includes a focus on tank warfare, mechanised artillery and infantry operations. The academy offers training in 'armored combat command, surveillance and intelligence, operational tactics' as well as in engineering disciplines relevant to operations involving the PLA Ground Force's armoured corps, such as materials science, mechanical engineering, electrical engineering and automation, communications engineering, weapons systems engineering and photoelectric information science.

Army Research Institute (□□□□□□□□□□□□□)

The Army Research Institute is an institution devoted to advanced defence research with applications to land warfare. The institute engages in a variety of defence research including radar technology, lasers, and hybrid electric vehicles. Researchers from the institute are known to have collaborated with partners from China's civilian universities in areas such as advanced manufacturing and automatic control, and laser technology.The Army Research Institute collaborates with civilian companies as part of China's military-civil fusion program. For example, General Guo Guangsheng from the Army Research Institute made a visit to Hong Run Precision Instruments Co. Ltd. (□□□□□□□□□□) on 24 August 2019 to assess how the company was performing in its military-civil fusion activities. Researchers from the Army Research Institute have also been involved in the product design and development of dual-use automobiles as part of a military-civil fusion project called 'Research, Development and Commerialisation of Advanced Off-road Passenger Vehicles' (□□□□□□□□□□□□□□□□□□□□□□). The project included research into vehicles such as the

BJ80 military and civilian off-road passenger vehicles as well as the BJ40L off-road vehicle.

Aviation Industry Corporation of China (□□□□□□□□□□□□□)

AVIC is a state-owned defence conglomerate established in 2008 that focuses on providing aerospace products for military and civilian customers. AVIC's main product lines include a variety of aircraft for freight, commercial and military aviation along with other more specialised products such as printed circuit boards, liquid crystal displays and automotive parts, according to Bloomberg. AVIC also provides services to the aviation sector through flight testing, engineering, logistics and asset management.The conglomerate has over 400,000 employees and has a controlling share in around 200 companies. AVIC has over 25 subsidiaries listed on its website.AVIC is the PLA Air Force's largest supplier of military aircraft, producing fighter jets, strike aircraft,

unmanned aerial vehicles and surveillance aircraft. Along with its core work on military aircraft, AVIC also produces surface-to-air, air-to-surface and air-to-air missiles. Its headline projects include the J-10 and the J-11 fighter aircraft. AVIC's subsidiary, the Shenyang Aircraft Corporation, was responsible for delivery of the J-15 fighter. Another subsidiary of AVIC, the Chengdu Aerospace Corporation, developed the PLA-AF's J-20 stealth fighter jet.

Aviation University of Air Force (□□□□□□□□□□□□□)

AUAF is one of China's main institutions devoted to the training of air force pilots. Its areas of focus are training in flight command and research into aeronautical engineering. Disciplines taught at AUAF include command science and engineering, aerospace science and technology as well as political work and military command.AUAF scientists publish and attend conferences on radar technology and electronic countermeasures. For example, scientists from AUAF's Information Countermeasures Division co-authored a publication on radar target recognition with a researcher from the PLA's Unit 94936 – an aviation unit stationed in Hangzhou. AUAF scientists have also done notable work on complex systems radar and signal pre-sorting.

Beihang University (□□□□□□□□)

Beihang University engages in very high levels of defence research as one of the 'Seven Sons of National Defence' subordinate to the Ministry of Industry and Information Technology. The university specialises in aviation and spaceflight research. The top four employers of Beihang graduates in 2018 were all state-owned missile or defence aviation companies. In total, 29% of 2018 Beihang graduates who found employment were working in the defence sector.Beihang scientists are involved in the development of Chinese military aircraft and missiles. In 2018, the university signed a comprehensive strategic cooperation agreement with China Aerospace Science and Technology Corporation, a state-owned conglomerate that produces ballistic missiles and satellites. The university is also noteworthy for its leading research on stealth technology.Beihang hosts at least eight major defence laboratories working on fields such as aircraft engines, inertial navigation and fluid dynamics.

Beijing Electronic Science and Technology Institute (□□□□□□□□□)

BESTI is a secretive university that trains information security experts for the bureaucracy. The institute is the only university run by the CCP General Office, which manages administrative matters for the Central Committee. The General Office is usually run by one of the general secretary's most trusted aides. It oversees China's cryptographic and state secrets agency as well as security for the party's leadership.BESTI has a student population of around 2,000 and has strict admission requirements. Students at the university are scrutinized for their political beliefs, and are typically CCP or Communist Youth League members. The activities of their relatives are screened for political issues. Having no parents or siblings who worked abroad or were involved in 'illegal organisations' is a condition of enrolment. The institute claims to count 50 ministerial-level party officials among its 12,000 graduates.BESTI has a close relationship with Xidian University and Beijing University of Posts and Telecommunications. The two universities are its primary collaborators on scientific papers. BESTI runs joint master's programs with Xidian University in cryptography, information and communication engineering, and computer applications technology. It also has joint doctoral programs with the University of Science and Technology of China and Beijing University of Posts and Telecommunications in cybersecurity.The university runs the Key Laboratory of Information Security (□□□□□□□□□/□□□□□□□□□□□□). Several websites claim that it runs a joint laboratory with the Chinese Academy of Sciences Institute of High Energy Physics, but this could not be confirmed.

Beijing Institute of Technology (□□□□□□)

BIT is one of the 'Seven Sons of National Defence' supervised by MIIT. It is a leading centre of military research and one of only fourteen institutions accredited to award doctorates in weapons science. In 2017, China's Ministry of Education ranked BIT and Nanjing University of Science and Technology as the country's top institutions for weapons science. It has received the most defence research prizes and defence patents out of all China's universities. 31.80% of BIT graduates in 2018 who found employment were working in the defence sector.BIT's claimed achievements include producing the PRC's first light tank, first two-stage solid sounding rocket and first low-altitude altimetry radar. The university also states that it carries out world-class research on several areas of missile technology including "precision strikes, high damage efficiency, maneuver penetration, long-range suppression, and military communications systems and counter-measures". In 2018, BIT

announced that it was running a four-year experimental program training some of China's top high school students in intelligent weapons systems.BIT is the chair of the B8 Cooperation Innovation Alliance (B8□□□□□□ or □□□□□□□□□□□), a group of eight Chinese research institutions that specialize in weapons science—the 'B' in 'B8' stands for Chinese work for armaments, bingqi (□□).BIT's central role in advancing PLA warfighting capability is demonstrated by the fact that it participated in the development of equipment used by 22 of the 30 squads in the 2009 military parade for the 60th anniversary of the founding of the PRC.

Central South University (□□□□)

Out of all universities subordinate to the MOE, CSU reportedly receives the most military research funding and was the first to receive a weapons production license. In 2008 and 2011 respectively, the defence industry agency SASTIND and the Ministry of Education (MOE) signed agreements to jointly supervise CSU. Under this arrangement, SASTIND committed to expanding CSU's involvement in defence research and support the development of its School of Aeronautics and Astronautics and Military Industry Technology Research Institute.CSU's defence research appears to focus on metallurgy, materials science, and aviation technology, including the development of heat-resistant materials for aeroplane and rocket engines. The university has been involved in the development of China's first atomic bomb, first intermediate-range ballistic missile, and first nuclear submarine. In 2018, it signed a strategic cooperation agreement with the Chinese Academy of Launch Vehicle Technology, a subsidiary of China Aerospace Science and Technology Corporation that is included on the US BIS Entity List for its involvement in developing rockets.

China South Industries Group (□□□□□□□□□□□□)

CSGC is a leading producer of armaments for the People’s Liberation Army. It was founded in 1999

and works on technologies such as advanced munitions, mobile assault weapons, lights armaments, information optoelectronics and counter-terrorism equipment. CSGC also maintains civilian product lines focused on the oil and energy sector, but most of the company's attention goes to developing armaments. The company employs nearly 200,000 personnel, its revenue approaches USD34 billion (AUD50 billion) and it is listed as a Fortune 500 company.CSGC holds a controlling share in more than 60 subsidiaries. 32 of these are listed on the company's website.

China State Shipbuilding Corporation (□□□□□□□□□□□□)

CSCC was established as one China's primary state-owned weapons companies on 1 July 1999 to build ships for military and civilian customers. CSSC markets itself as as the 'backbone' of the Chinese navy and its core products include a variety of warships and support vessels. Alongside its program supporting the PLA Navy, Bloomberg notes that CSSC 'produces oil tankers, bulk carriers, conditioner vessels, deepwater survey ships, and marine equipment.'On 2 July 2019, it was announced that the China Shipbuilding Industry Corporation and the CSSC would merge. According to Jane's Defence Weekly, 'the two groups, which have combined assets of about USD120 billion (AUD178 billion) and employ 240,000 people, dominate naval shipbuilding in China and between them operate 160 subsidiaries.'

China University of Geosciences (Wuhan) (□□□□□□)

CUG is subordinate to the Ministry of Education and also supervised by China's Ministry of Land and Resources. It is actively engaged in defence research and training on geology, hosting the defence-focused Ministry of Education Key Laboratory on Geological Exploration and Evaluation. The laboratory was established in 2018, has 56 staff, and trains students in 'military geology'.CUG gained secret-level security credentials in 2009, enabling it to participate in classified defence projects.

China University of Mining and Technology (□□□□□□)

CUMT is subordinate to the Ministry of Education and specialises in engineering and other mining and industry-related disciplines. It engages in low levels of defence research.CUMT's defence research revolves around manufacturing and design, materials science, control science, electronic components, power and energy, and bionics. It appears to be involved in the construction and design of underground bunkers for the military. The academic committee of its State Key Laboratory for Geomechanics and Deep Underground Engineering (□□□□□□□□□□□□□□□□□□□□) is headed by PLA underground engineering expert Qian Qihu (□□□).

Chinese Academy of Engineering Physics (□□□□□□□□□□)

CAEP was founded in 1958 and now has over 24,000 employees. It is headquartered in Mianyang, Sichuan Province, but also has facilities in Chengdu and Beijing. Notably, Mianyang is home to a military-civil fusion (MCF) demonstration base—the Sichuan Mianyang High-Technology City. Sichuan Military District Commander Jiang Yongshen (□□□) in 2016 stressed the important role that Mianyang plays in China's larger science and technology development and the significance of its military-civil fusion (MCF) demonstration base.The academy is best known for nuclear weapons, but also carries out research on directed-energy weapons. CAEP's four main tasks are to develop nuclear weapons, research microwaves and lasers for nuclear fusion ignition and directed-energy weapons, study technologies related to conventional weapons, and deepen military-civil fusion. It claims that its research covers 260 specialising, primarily in the broad areas of physics and mathematics, mechanics and engineering, materials and chemistry, electronics and information, and optics and electrical engineering.CAEP hosts part of the Tianhe-2 supercomputer, one of the worlds fastest supercomputers.Despite the sensitivity of its work, CAEP has expanded its international presence in recent years. It claims to send hundreds of scientists overseas to study or work as visiting scholars. CAEP has also used Chinese government talent recruitment schemes such as the Thousand Talents Plan to recruit dozens of scientists from abroad. By 2015, CAEP had recruited 57 scholars through the Thousand Talents Plan, making it one of the largest recruiters of Thousand Talents Plan scholars.CAEP maintains strong collaborative relationships with Chinese civilian universities. It runs a joint laboratory with the University of Electronic Science and Technology of China and collaborates with universities and research institutions including the Chinese Academy of Sciences, the University of Science and Technology of China, Shandong University, Southwest University of Science and Technology, Sichuan University, Jilin University, Peking University and Tsinghua University. CAEP sponsors postgraduate students in many of these institutions who are required to work there for five years after graduating.

Chongqing University (□□□□)

CQU is a leading Chinese research institution subordinate to the Ministry of Education. Chongqing University is home to at least two laboratories devoted to defence research on nanotechnology and control systems. An institution accredited to conduct classified research, Chongqing University is active in improving its security culture with respect to the safeguarding of official secrets.In December 2016, the Ministry of Education entered an agreement with defence industry agency SASTIND to advance military-civil fusion at Chongqing University. Following this agreement, Chongqing University established the defence-focused Ministry of Education Key Laboratory for Complex Systems Safety and Autonomous Control, which works on control systems engineering in May 2018.

Chongqing University of Technology (□□□□□□)

CQUT is a member of the B8 Cooperation Innovation Alliance (B8□□□□□□ or □□□□□□□□□□), a group of eight Chinese research institutions that specialize in armament science—the ‘B’ in ‘B8’ stands for the Chinese word for armaments, bingqi (□□). However its involvement in defence research does not appear as expansive as the other B8 members and it is a relatively low-ranked university. In 2017, its president stated that ‘Chongqing is an important site for the weapons industry, but its military-industrial research and development ability has not yet upgraded.’ Unlike the other members of the B8, SASTIND does not appear to supervise the university.The university has links to Norinco Group and China South Industries Group, China’s largest weapons manufacturers, and was under the supervision of the conglomerates’ predecessor, China Ordnance Industry Corporation, until 1999. In 2017 and 2018, it signed a partnerships with four local defence companies to collaborate on research and training.In 2011, CQUT received secret-level security credentials, enabling it to participate in classified defence projects.

Commercial Aircraft Corporation of China (□□□□□□□□□□□□)

COMAC was established in 2008 as a state-owned manufacturer of large commercial aircraft. The company oversees eleven subsidiaries that focus on various aspects of aircraft production. A list of COMAC’s subordinate companies can be found in English on the company’s website.Despite its focus on commercial aircraft, China’s Ministry of Industry and Information Technology has referred to it as a defence industry conglomerate. The company maintains strong links to China’s defence industry and some of its leadership is drawn from former executives at state-owned military aircraft and missile manufacturers. China’s leading producer of military aircraft, the Aviation Industry Corporation of China (AVIC), also holds a 10 per cent share in COMAC. COMAC supports the continued development of China’s defence industry by awarding ‘national defence technology scholarships’ to Chinese university students.COMAC’s signature passenger aircraft, the C919, offers an example of how the company could use its civilian aircraft production for military purposes. Numerous Chinese analysts have studied Boeing’s conversion of the 737 into the P-8 Poseidon and E-7A surveillance aircraft and argue that the C919 could also be retrofitted for early warning as well as anti-surface and anti-submarine warfare missions. With a greater flight range than China’s other military aircraft, a retrofitted C919 for maritime surveillance operations could reduce China’s dependence on artificial air bases in the South China Sea which currently render aircraft vulnerable to corrosion due to harsh weather conditions. Vice-Chairman of the Central Military Commission, Zhang Youxia, reportedly expressed an interest in learning from American companies in converting civilian aircraft into military aircraft while inspecting COMAC’s C919.

Criminal Investigation Police University of China (□□□□□□□□□)

CIPUS was founded in May 1948 and underwent several name changes, but was upgraded in 1981 to become the first police university offering a specialised undergraduate degree program. It runs a national engineering laboratory, two MPS key laboratories, and provincial key laboratories. It is focused on training in criminal investigation, criminology science and technology and criminal law.The university also has relationships with companies that provide the technological tools that contribute to the PRC's public security apparatus. For instance, it has a relationship with the company Haiyun Data on public security intelligence. Haiyun provides data visualization services for MPS bureaus across China.

Dalian Minzu University (□□□□□□)

DLMU was established in 1984 as an institution that researches China's ethnic minorities. The university is overseen by the State Ethnic Affairs Commission (SEAC), the Liaoning Provincial Government and the Dalian Municipal Government.Scientific disciplines taught by DLMU include communications and information engineering, machine engineering, civil engineering and environmental science. DLMU also researches political thought and minority groups of northeast China.DLMU currently hosts the Dalian Key Lab of Digital Technology for National Culture (□□□□□□□□□□□□□□□□). Researchers at laboratory carry out research on facial recognition of ethnic minorities. The laboratory has collaborated with an academic from Curtin University on research related to the facial recognition of Tibetans, Koreans and Uyghurs—over one million of whom have disappeared into re-education camps. DLMU researchers are working on a database of facial and optical movements across different ethnic groups.DLMU also hosts the State Ethnic Affairs Commission Key Laboratory of Intelligent Perception and Advanced Control (□□□□□□□□□□□□□□□□□□), housed within the university's College of Electromechanical Engineering (□□□□□□). The laboratory has done work on convolutional neural networks for visual image recognition, which could have applications for surveillance technology.DLMU's party committee has an active United Front Work Department. The department supervises non-CCP members and students returning from overseas study. Management of religious and ethnic minorities are likely to be other priorities for the department.

Dalian University of Technology (□□□□□□)

DLUT is directly under the administration of the Ministry of Education. In 2018, it came under the supervision of defence industry agency SASTIND as part of the government's efforts to deepen military-civil fusion in the university sector. In 2006, the university received secret-level security credentials, allowing it to participate in classified defence technology projects. Since then, it has expanded cooperation with the PLA Navy and joined several military-civil fusion innovation alliances.In 2015, the university established a defence laboratory in the School of Mechanical Engineering. The laboratory was proposed by a professor within the University's Institute of Science and Technology. The Institute of Science and Technology is primarily responsible for high-tech project management, where they manage projects for the 973 Program, the National Natural Science Foundation, and the Ministry of Education.

Donghua University (□□□□)

DHU is subordinate to the Ministry of Education. It is actively involved in defence research on materials. It hosts the Key Laboratory of High Performance Fibers & Products, a defence-focused laboratory involved in materials science and textiles engineering research for China's defence industry and weapons systems. The laboratory is specifically involved in developing materials for weapons casings, vehicular armour, aviation and cabling. The university holds secret-level security credentials, allowing it to participate in classified defence research projects.DHU claims that much

of its research has been applied to fields such as defence technology and aviation, and contributed towards China's space program and Beidou satellite navigation system. In 2018, the university signed a strategic cooperation agreement with the state-owned Jihua Group (□□□□) for collaboration on textiles to meet the military's needs.

East China University of Technology (□□□□□□)

ECUT was founded in 1956 as the first institution of higher education for China's nuclear industry. Since 2001, it has been subject to four 'joint construction' agreements between the Jiangxi Provincial Government and defence industry agency SASTIND or its predecessor COSTIND. These agreements are designed to develop the university's involvement in defense-related research and training. The Ministry of Natural Resources and defence conglomerate China National Nuclear Corporation are also involved in supervising and supporting ECUT.ECUT carries out defence research related to nuclear science and hosts a defence laboratory on radioactive geology. It holds secret-level security credentials, allowing it to participate in classified defence technology projects. In 2006, the East China University of Technology National Defence Technology Institute (□□□□□□□□□□□□) was established.

Fudan University (□□□□)

Fudan University is among China's best universities. It was ranked 104th in the world by Times Higher Education in 2019. The university appears to engage high levels of work for the military on materials science, including stealth technology.All defence-related projects and matters in Fudan are managed by the university's Institute of Special Materials and Technology (□□□□□□□□□□□□□) and Defence Industry Secrets Committee (□□□□□□□□□□□□). The Institute of Special Materials and Technology specialises in defence research and works on simulations, precision manufacturing, and materials. Professor Ye Mingxin, the institute's director, is also an advisor to the PLA and defence companies on materials science. Fudan University's Materials Science Department includes one professor who is described as specifically being a 'defence system professor', which may refer to Professor Ye. In 2011, Fudan established a State Secrets Academy (□□□□□□), in partnership with China's National Administration of State Secrets Protection (□□□□□). The institute carries out research and training on the protection of state secrets.

Hangzhou Dianzi University (□□□□□□□□)

HDU specialises in information technology and has been jointly supervised by the Zhejiang Provincial Government and defence industry agency SASTIND since 2007. The university is Zhejiang Province’s only provincial-level higher education institution to have officially designated national defence disciplines.HDU’s leadership is closely integrated with its defence research. Since its creation in 2008, the university’s main defence laboratory has been run by Xue Anke, who was the university’s president until 2017. While president, Xue served on an expert advisory committee to the PLA on information technology. He is also a member of the Zhejiang Provincial Expert Committee on Artificial Intelligence Development.Key areas of defence research at HDU include electronics, artificial intelligence, military-use software, and communications and information systems. HDU has been expanding its research on artificial intelligence, establishing a school of artificial intelligence and an artificial intelligence research institute in 2018.HDU holds secret-level security credentials, allowing it to undertake classified weapons and defence technology projects. In 2011, the Zhejiang State Secrets Bureau established a State Secrets Academy in HDU. The academy, one of twelve in the country, trains personnel in managing and protecting confidential information.

Hangzhou Normal University (□□□□□□)

Hangzhou Normal University is a Chinese university subordinate to the Zhejiang Provincial Government. The university was initially established in 1978 as Hangzhou Normal College (□□□□□□) to focus on teacher training, art education as well as research in the humanities and natural sciences. Hangzhou Normal University retains this broad academic focus and oversees faculties such as the Alibaba Business School (□□□□□□□).Hangzhou Normal University collaborates with China's MPS on the development of surveillance technology. In March 2019, the university entered into an agreement with the Zhejiang Police College, the Zhejiang Public Security Office, and Hikvision—China's leading producer of video surveillance technology—to establish a joint laboratory. The joint laboratory reportedly focuses on applying big data analysis, cloud computing and internet of things technology to improve China's policing capability.

Harbin Engineering University (□□□□□□□)

HEU is one of China's top defence research universities. The university is a leading centre of research and training on shipbuilding, naval armaments, maritime technology and nuclear power. 36.46% of the university's 2017 graduates who found employment were working in the defence sector.As one of the group of universities subordinate to the Ministry of Industry and Information Technology (MIIT) known as the 'Seven Sons of National Defence' (□□□□), HEU is an integral part of China's defence industry. HEU's achievements include producing China's first experimental submarine, ship-based computer, and hovercraft. The university claims to have participated in most of the PLA Navy's submarine, undersea weapon, and warship projects.HIT's role in the defence industry is highlighted by its formal affiliation with the PLA Navy, which became a supervising agency of the university in 2007. Under the supervisory agreement, the PLA Navy committed to developing HEU's capacity as a platform for research and development in military technology and for training defence personnel. The following year, HEU established a Defence Education Institute to train reserve officers. Since then, the institute has trained at least 1,700 officers. HEU also maintains a joint laboratory with the PLA Navy Coatings Analysis and Detection Center.HEU is an important hub research on nuclear engineering, including on nuclear submarines. In 2018, it signed a co-construction agreement with defence conglomerate China National Nuclear Corporation (CNNC). In 2019, HEU and CNNC established the China Nuclear Industry Safety and Simulation Technology Research Institute. HEU also runs a joint laboratory on energetic materials (such as explosives) with the Chinese Academy of Engineering Physics, China's nuclear warhead research organisation.

Harbin Institute of Technology (□□□□□□□)

HIT is one of China's top defence research universities. As one of seven universities run by MIIT, it is known as one of the 'Seven Sons of National Defence' (□□□□). The Seven Sons of National Defence all have close relationships with the Chinese military and are core training and research facilities for China's defence industry. In 2018, HIT spent RMB1.97 billion (AUD400 million)—more than half of its research budget—on defence research. 29.96% of the university's graduates that year who found employment were working in the defence sector.HIT has been described by Chinese state media as having 'defence technology innovation and weapons and armaments modernisation as its core'. It excels in satellite technology, robotics, advanced materials and manufacturing technology, and information technology. Other areas of defence research at HIT include nuclear technology, nuclear combustion, nuclear power engineering and electronic propulsion and thruster technology, many of which are officially designated as skill shortage areas for the Chinese defence industry.HIT is best known for its aerospace research and has a close relationship with China Aerospace Science and Technology Corporation (CASC), a state-owned defence company that specialises in long-range ballistic missile and satellite technology. Since 2008, HIT and CASC have operated a joint research centre. Defence conglomerates CASC, CASIC, AVIC and CETC rank among the top employers of HIT graduates. The university is a major source of cyber talent and receives funding for information security research from the MSS, China's civilian intelligence agency. A report prepared for the US–China Security and Economic Review Commission identified it as one of four universities focused on research with applications in information warfare. In 2003, HIT founded its Information Countermeasures Technology Research Institute (□□□□□□□□□□□□□□□□□).

Hebei University (□□□□)

Hebei University is Hebei Province's only comprehensive university. The university subordinate to the Ministry of Education and also supervised by the Hebei Provincial Government and defence industry agency SASTIND. Its supervision by SASTIND, which began in 2013, is designed to support the university in 'strengthening its national defence characteristics'.HBU appears to be relatively secretive about its defence research. In 2017, SASTIND designated an area of research at the university's College of Physics Science and Technology as a 'discipline with defence characteristics'. An article about this on the university's news site has been taken down and deliberately did not specify the discipline. However, a speech given by the head of the college named military-use power and energy as HBU's only defence discipline. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects.In 2017, HBU held a forum on military-civil fusion for technology and innovation to 'uncover the university's potential for defence-industry technological research' and encourage greater integration with defence companies.

https://unitracker.aspi.org.au/universities/hebei-university

Hebei University of Science and Technology (□□□□□□)

HEBUST engages in moderate but growing levels of defence research. It has been supervised by defence industry agency SASTIND since 2013, when SASTIND and the Hebei Provincial Government agreed to jointly develop the university's involvement in defence research. By 2017, the university claimed to have completed 300 defence projects. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects.While the university does not appear to have any dedicated defence laboratories, it has described five of its laboratories as platforms for defence research. Areas of materials science, mechanical engineering and control science at HEBUST have been designated 'disciplines with national defence charcteristics' by SASTIND. HEBUST may also be pursuing greater integration between China's defence needs and the university's research on textiles engineering and biological fermentation.HEBUST states that is has developed close cooperation with China Electronics Technology Group Corporation's 54th Research Institute, an organization blacklisted by the US Government Entity List. Defence industry conglomerate Aviation Industry Corporation of China also funds research at the university.

Hefei University of Technology (□□□□□□)

HFUT a leading Chinese university subordinate to the Ministry of Education. It specialises in engineering and engages in growing levels of defence research, particularly in the fields of advanced materials, smart manufacturing and electronic information. As of 2018, HFUT was the only civilian university in Anhui Province fully certified to carry out military projects, holding secret-level security credentials, and had undertaken over 200 such projects.In 2018, the university came under a 'joint-construction' agreement between the Ministry of Education and defence industry agency SASTIND. According to HFUT, this agreement 'will powerfully advance the university's development of national defence disciplines, training of talent for defence industry, and construction of defence industry and national defence research platforms.'Miao Wei, head of the Ministry of Industry and Information Technology, which oversees China's defence industry, is a graduate of HFUT.

Heilongjiang Institute of Technology (□□□□□□□)

HLJIT is an engineering-focused university that engages in growing levels of defence research. In 2015, the Heilongjiang Provincial Government partnered with defence industry agency SASTIND to expand the university's ability to 'show its national defence characteristics and serve the national defence science and technology industry.'SASTIND has designated military-use power and energy, optoelectronics and laser technology, and computing as three 'disciplines with national defence characteristics' at HLJIT. In June 2016, HLJIT and ZTE jointly launched an MOE-ZTE ICT Product-Teaching Integration Innovation Base (□□□-□□□□ICT□□□□□□□□) and established the Heilongjiang School of Engineering-ZTE Information and Communications Technology College (□□□□□□□-□□□□□□□□□□). ZTE has been reportedly barred from US government contracts.As it increases its implementation of military-civil fusion, HLJIT has developed relationships with defence conglomerates. The university is particularly close to China Aerospace Science and Technology Corporation (CASC), a leading state-owned manufacturer of long-range missiles and satellites. In 2017, HLJIT partnered with a subsidiary of CASC to establish a joint research centre, the Aerospace Smart City Research Institute. The subsidiary, Aerospace Shenzhou Smart System Technology Co., Ltd. (□□□□□□□□□□□□□□□), specialises in smart city and informatization technology.HLJIT holds confidential-level security credentials, allowing it to participate in confidential defence technology projects.

Heilongjiang University (□□□□□)

HLJU is supervised by the Ministry of Education, the Heilongjiang Provincial Government and SASTIND. SASTIND's supervision of the university is designed to promote its integration with China's defence technology goals. In 2016, the year after HLJU came under SASTIND's supervision, the university received third-class security credentials and funding for a national defence technology research project for the first time. Third-class security credentials allow the university to participate in confidential defence research projects. By 2018, HLJU claimed to have received RMB13 million (AUD2.7 million) in defence research funding.HLJU has close ties with Russian universities and is best known for its work in the Chemistry, Chemical Engineering and Materials Department, which entered the top 1 percent of ESI's global rankings.

Henan University of Science and Technology (□□□□□□)

HAUST is Henan province's leading civilian university for defence research. In 2008, it became the first university in the province to receive security credentials allowing it to participate in classified weapons projects. In 2016, it became the province's only university subject to a 'joint-construction' agreement with defence industry agency SASTIND, an arrangement designed to increase HAUST's involvement in defence research. As early as 2009, the university stated that it had made great contributions to the defence and aviation industries, undertaking large amounts of defence research projects.HAUST describes itself as China's primary university for research and training for the mechanical bearings (such as ball bearings) industry. SASTIND has designated three areas of research at the university as 'disciplines with defence characteristics', covering systems engineering, materials science and mechanics. The university is actively involved in military-civil fusion activities.The university claims to have made important contributions to the development of bearings for aircraft engines, satellites, and spacecraft. It states that it has resolved critical technological problems for specific weapons guidance systems, ballistic missile testing systems and an infrared targeting and interference emulation system that are probably used to test guided missiles.

Huazhong University of Science and Technology (□□□□□□)

HUST is one of China's leading research institutions. While the university is subordinate to the Ministry of Education, it has also been supervised by the State Administration of Science, Technology and Industry for National Defense since 2012.The university hosts at least six laboratories dedicated to defence research. Its National Defence Research Institute reportedly oversees defence research in seven other HUST research centres. Artificial intelligence, shipbuilding, image processing, navigation technology, mechanical engineering, electronics, materials science and laser physics are focuses of HUST's defence research.HUST has worked closely with the PLA and China's defence industry. This collaboration includes the development artificial intelligence and imaging technology for weapons. The university's work on pulsed power is linked to China's nuclear and directed-energy weapons program. China's state-owned defence conglomerates and China's nuclear warhead facility sponsor dozens of HUST postgraduate students each year, who are required to work at their sponsoring organisation for at least five years after graduating.HUST holds secret-level security credentials, allowing it participate in research and production for classified weapons and defence projects.

Hunan University (□□□□)

HNU is a leading Chinese university subordinate to the Ministry of Education. In recent years, its participation in defence research appears to have grown substantially. In 2010, it established the National Supercomputer Center in Changsha jointly with the PLA National University of Defense Technology, which has since been placed on the US Government Entity List for its suspected role in nuclear weapons research.In 2011, China's defence industry agency, SASTIND, entered a partnership with the MOE to expand the university's participation in defence research and defence industry ties. This arrangement was renewed in 2016. In 2013, SASTIND and the Hunan Provincial Government also signed an agreement to jointly support the development of the university's National Supercomputer Center.HNU holds secret-level security credentials, enabling it to participate in research and production for weapons and other defence projects.

Information Engineering University (□□□□□□□□□□□□□□)

IEU was formed in June 2017, combining the old Information Engineering University with the PLA Foreign Languages University. PLA experts have described IEU as ‘the sole military academy for the cyber and electronic warfare arms of China’s network-electronic forces’.The IEU is currently subordinate to the PLA Strategic Support Force’s Network Systems Department, which holds the military’s signals intelligence capabilities. Previously, the university was run by the General Staff Department Third Department (commonly known as 3PLA), the PLA’s signals intelligence service that has been incorporated into the Strategic Support Force. IEU’s command tracks include Network Engineering (□□□□), which is dedicated to the cultivation of cyber attack and defense technical cadre (□□□□□□□□). It is responsible for the construction of the Henan Provincial Laboratory of Visible Light Communication (□□□□□□□□□□□□□).The university is primarily known for research and training on hacking, cryptography, signals processing, surveying and mapping, and navigation technology. However, since absorbing the PLA Foreign Languages University, it now serves as one of the most important language schools for Chinese military intelligence officers, describing itself as a ‘whole-military foreign languages training base for individuals going abroad’. While the PLA Foreign Languages University is best known for training signals intelligence officers, it has also trained many officers in the PLA’s political warfare wing, the Central Military Commission Political Work Department Liaison Bureau.

Jilin University (□□□□)

JLU is directly under the administration of the Ministry of Education and came under the joint supervision of the ministry and defence industry agency SASTIND in 2016. In 2017, SASTIND designated eight fields of research at JLU as national defence disciplines, indicating the university carries out high levels of defence research. In 2012, JLU spent roughly RMB60 million (AUD12.5 million) on defence research, a number that is likely to have grown substantially.JLU's National Defense Science and Technology Research Institute, also known as the Advanced Technology Research Institute, was established in April 2006 and is responsible for the organization and management of the university's national defence science and technology projects. The research institute has received several certifications to conduct research for military applications. It conducts research in collaboration with the former PLA General Armaments Department, SASTIND, and state-owned defence conglomerates in the fields of aviation, aerospace, electronics, nuclear technology, and shipbuilding.JLU's State Key Laboratory of Superhard Materials (□□□□□□□□□□□□) works closely with China's nuclear weapons complex, the Chinese Academy of Engineering Physics (CAEP). Job advertisements for a CAEP subsidiary, the Center for High Pressure Science & Technology Advanced Research (□□□□□□□□□□□) state that it has a branch within Jilin University. This suggests that CAEP may even be involved in managing the State Key Laboratory of Superhard Materials.The university hosts at least two defence research labs, located in the university's College of Computer Science and Technology and in the College of Chemistry. Its Key Laboratory of Attack and Defense Simulation Technology for Naval Warfare, Ministry of Education (□□□□□□□□□□□□□□□□□□□□□□B□□) is involved in cybersecurity research for the Navy. The lab's academic committee is headed by a computer scientist from China Aerospace Science and Technology Corporation, a leading state-owned missile manufacturer.JLU holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence technology projects.

National University of Defense Technology (□□□□□□□□□□□□□)

In 2017, NUDT was reformed and placed in charge of the Institute of International Relations in Nanjing, the National Defense Information Institute in Wuhan, the Xi’an Communications College, the Electrical Engineering Institute in Hefei, and the College of Meteorology and Oceanography in Nanjing. The Institute of International Relations in Nanjing is a key training centre for intelligence officers.NUDT is known for its research on supercomputers, autonomous vehicles, hypersonic

missiles and China's Beidou Navigation Satellite System. The university developed the Tianhe-2A supercomputer at the National Supercomputing Center in Guangzhou, the world's fastest supercomputer from 2013 to 2016. NUDT's Tianhe-1A supercomputer is based at Hunan University's National Supercomputing Center Changsha (□□□□□□□□□□).For over a decade, NUDT has aggressively leveraged overseas expertise and resources to build its capabilities. The Australian Strategic Policy Institute's International Cyber Policy Centre's October 2018 report 'Picking flowers, making honey: The Chinese military's collaboration with foreign universities' documented and analysed NUDT's overseas presence. The report found that by 2013 the university had sent over 1,600 of its professors and students to study and work abroad. Universities in the United States, the United Kingdom, Australia, Canada, Singapore, the Netherlands and Germany engage in some of the highest levels of collaboration with NUDT. Some of NUDT's leading experts on drone swarms, hypersonic missiles, supercomputers, radars, navigation and quantum physics have been sent to study or work abroad.Defected Chinese spy Wang Liqiang claimed in 2019 that NUDT's 'Intelligence Center' sent him fake passports for his mission to interfere in Taiwanese politics. This indicates that the university plays an important role in supporting China's overseas intelligence activity.NUDT also works with foreign technology companies. Google and Microsoft have both worked with and trained NUDT scientists.

Naval Command College (□□□□□□□□□□□□□)

The Naval Command College is an institution that provides education and training for naval officers in a variety of disciplines such as military thought, strategic studies, intelligence training and political work along with military operations, tactics and campaigns. The college plays a crucial role in improving the quality of PLA Navy personnel, as well as providing combined arms training for mid-career political commissars, logistics officers and equipment officers. The college serves to improve strategic and tactical thinking in the PLA Navy by hosting the Naval Campaigns and Tactics Center Laboratory (□□□□□□□□□□□) and producing research that looks at operationalising new training and command systems. It is the PLA-N's last remaining command academic institution.

Naval Research Academy (□□□□□□□□□□□□□)

The Naval Research Academy was established in July 2017 following Xi Jinping's military reforms. Main areas of study include military theory and technological research as well as the maritime environment and national defence engineering.The Naval Research Academy actively collaborates with civilian universities as part of China's military-civil fusion program. In April 2019, delegates from the Naval Research Academy attended a meeting with officials from Xi'an Jiaotong University on co-operation directed at improving the quality assurance and technological reliability of complex armaments currently in service in the PLA Navy. Major General Li Wei from the Naval Research Academy stated that his colleagues were paying 'very close attention to this co-operation with Xi'an Jiaotong University' in the development and sustainment of naval equipment.The Naval Research Academy also collaborates with civilian research institutes. For example, the Institute for Industrial Military-Civil Fusion at the Research Institute of Machinery Industry Economic and Management claims to have worked with the Naval Research Academy and a number of state-owned enterprises that focus on defence technology such as China Shipbuilding Industry Corporation (CSIC) in order to develop strategies for military-civil fusion.The Naval Research Academy's involvement in military-civil fusion is particularly notable for work on maritime information technology and equipment. In January 2019, delegates from the Naval Research Academy attended a conference hosted by the National Key Laboratory of Underwater Acoustic Science and Technology (□□□□□□□□□□□□□□) and the Key Laboratory of Marine Information Acquisition and Security Industry and Information Technology (□□□□□□□□□□□□□□□□□□□□□□□) of Harbin Engineering University (HEU). The Naval Research Academy's Liu Qingyu (□□□) was reported to have made a presentation on international and domestic developments in marine sonar technology at the conference.Liu Qingyu from the Naval Research Academy has a particularly strong record of engagement with civilian and military institutions for his research into marine sonar technology. In 2018, Liu delivered a presentation to the Northwestern Polytechnical University (NPU) which 'elaborated on some of the problems facing the national costal defence industry' and 'suggested areas for future research into marine acoustics.' Both students and academics from NPU attended Liu's presentation. Liu has also published papers on acoustic science with scholars from the Chinese Academy of Sciences, the Naval University of Engineering, and Northwestern Polytechnical University.

Naval University of Engineering (□□□□□□□□□□□□□□)

NUE is one of the PLA's five comprehensive universities, which trains students in a variety of engineering and core military disciplines related to naval warfare.The university is home two national laboratories. The National Key Laboratory for Vessel Integrated Power System Technology (□□□□□□□□□□□□□□□□□), which was established in 2010 to carry out 'indigenous research and development' into integrated electric propulsion (IEP) systems that power naval vessels at sea. IEP generally uses diesel generators and/or gas turbines to generate the electricity needed in order to turn propellers on large surface vessels such as guided missile destroyers or amphibious assault ships. The lab is jointly run by NUE and China Shipbuilding Industry Corporation's (CSIC) 712th Research Institute.Rear Admiral Ma Weiming has led the National Key Laboratory for Vessel Integrated Power System Technology to develop propulsion systems for aircraft catapults, electromagnetic weapons and satellite launches. Admiral Ma has been referred to as 'the father of China's electromagnetic catapult system' (□□□□□□□□) by official Chinese media sources.NUE's National Defense Technology Key Laboratory of Marine Vibration and Noise (□□□□□□□□□□□□□□□□) works on acoustic quieting technology for submarines. The lab is probably jointly run with CSIC's 701st Research Institute, also known as China Ship Development and Design Center (□□□□□□□□□□).Another laboratory that conducts defence research at NUE is the Nuclear Marine Propulsion Engineering Military Key Laboratory (□□□□□□□□□□□□□□). The lab focuses on researching and training engineers in nuclear engineering for warships and submarines.Academic departments at the Naval University of Engineering include:

North University of China (□□□□)

NUC is a civilian university that specailises in defence research. It is jointly administered by the Shanxi Provincial Government and defence industry agency SASTIND. The university traces its roots back to an ordnance school established by the Eighth Route Army in 1941, and defence research is central to its identity. According to NUC's website, 'Our university has long established

excellent and cooperative relationships with Central Military Commission departments, SASTIND, Norinco Group, China South Industries Group, China Aerospace Science and Technology Group, China Aerospace Science and Industry Group, and our graduates are spread across different areas in defence industry.' Approximately 2000 of its graduates enter the defence industry each year.NUC specialises in testing and developing weapons, including tanks, missiles and explosives. Its Underground Target Damage Technology National Defense Key Subject Laboratory reportedly runs the only underground shooting range in a Chinese university. The university is a member of the B8 Cooperation Innovation Alliance (B8□□□□□□ or □□□□□□□□□□), a group of eight Chinese research institutions that specialize in armament science—the 'B' in 'B8' stands for Chinese work for armaments, bingqi (□□).

Northwestern Polytechnical University (□□□□□□)

The university is one of the 'Seven Sons of National Defence' subordinate to MIIT. It is heavily engaged in military research, describing itself as 'devoted to improving and serving the national defence science and technology industry.' NWPU's research focuses on aviation, space and naval technology. Between 2014 and 2018, the university's School of Mechanics, Civil Engineering and Architecture alone spent nearly RMB200 million (AUD40 million) on defence research projects. 41.25% of 2017 NWPU graduates who gained employment were working in the defence sector.NWPU is known for its development of unmanned aerial vehicles (UAVs). The only Chinese university hosting a UAV defence laboratory, NWPU produces the ASN series of UAVs though its subsidiary company, Aisheng Technology Group Co., Ltd. The Chinese military is the company's largest customer and the company once claimed to produce 90% of China's drones.The university has close ties to state-owned shipbuilding and aerospace conglomerates.

Officers College of the PAP (□□□□□□□□□□□□□□□)

The Officers College of the PAP was established as an institution devoted to training officers of China's paramilitary service in command and engineering disciplines. The college's research focusses on combat command, command information systems engineering, philosophy, law, political education, Chinese language and literature, history, mathematics, physics, applied psychology, electrical science and technology, computer science and technology, and management science and engineering.The Officers College of the PAP is especially active in developing drone technology. On 26 June 2019, the college tested its X-Swift unmanned aerial vehicles (UAV) for a test surveillance and reconnaissance flight with special operations personnel in Sichuan.The college is also active in developing applications for drone technology. Researchers from the college have collaborated with personnel from the PLA Logistics Engineering University to publish an article in favour of deploying UAVs to southern Xinjiang for counter-terrorism missions. The researchers argue for UAVs to be deployed for regional surveillance and strike as well as search and seizure missions in Xinjiang, drawing off lessons from the US coalition against ISIS.

People’s Public Security University of China (□□□□□□□□□)

PPSUC was founded in July 1948. In 1984, it was developed into a full-time higher education institution with master’s and bachelor’s degree programs. In 1998, it was merged with the Chinese People’s Police University (□□□□□□□□). Its schools include a Marxism School, Law School, Law and Order School, Investigation and Anti-Terrorism School, Criminology School, Pubic Security Management School, International Policing and Law Enforcement School, Police Training College (which covers combat training and command and tactical training), Criminal Science and Technology School, Information Technology and Network Security School, and a Traffic Management School.PPSUC is involved in the development of technological tools for public security applications, including image recognition. For instance, the university signed an agreement with Chinese video surveillance equipment manufacturer Hikvision in 2016 to set up a joint laboratory on video image recognition technology. In 2018, it signed a strategic cooperation agreement with Xiamen Meiya Pico Information Co., a Chinese company that provides digital forensics and information security products, which included upgrading a forensics laboratory and establishing a cyber security attack and defence laboratory.The university also has cooperation agreements with numerous local government-level public security bureaus across the PRC. These include agreements on image recognition technology for local public security bureaus and joint laboratories. For instance, in 2018 alongside the Nanshan sub-bureau of Shenzhen Public Security Bureau and the artificial intelligence companies SenseTime and Shenzhen Yuantian Lifei, it signed a strategic cooperation agreement on applying video recognition and the establishment of a joint laboratory.

Shenzhen University (□□□□)

SZU is the primary university in China's rapidly growing technology hub, Shenzhen. The university does not appear to engage in high levels of defence research outside of its national defence laboratory on automatic target recognition. The laboratory was founded in 2001, is overseen by the PLA and SASTIND, and is headed by the university's former president.

Shijiazhuang Tiedao University (□□□□□□□)

STDU specializes in transportation science, engineering and information technology. Its predecessor was the PLA Railway Engineering College.Since 2013, STDU has also been supervised by defence industry agency SASTIND through an arrangement designed to expand the university's involvement in defense-related research and training. STDU has secret-level security credentials, allowing it to participate in classified defense technology research.STDU is home to the National Defense Transportation Research Institute (□□□□□□□), which is the only civilian university research institute that specializes in national defense transportation research. STDU is also home to the Institute of Complex Networks and Visualisations (□□□□□□□□□□□□), which develops military-use information processing software including remote-control systems for aerospace applications.

Sichuan University (□□□□)

Sichuan University (SCU) is a leading Chinese university subordinate to the Ministry of Education. In 2011 and again in 2016 SCU was the subject of joint construction agreements between the MOE and defence industry agency SASTIND designed to increase its involvement in defence research.The university hosts at least three laboratories that focus on defence research and has a close relationship with the Chinese Academy of Engineering Physics (CAEP), the PRC's primary nuclear warheads research facility. SCU's Institute of Atomic and Molecular Physics and CAEP jointly established the Institute of Atomic and Molecular Engineering and the Institute of High Temperature and High Pressure Physics. In 2012, SCU was added to the US BIS Entity List as an alias of CAEP, implying that it acts as a proxy for the facility.A 2011 study by American think tank Project 2049 concluded that a PLA signals intelligence unit 'likely maintain a close, mutually supportive relationship with related organizations in Chengdu, such as Sichuan University's Information Security and Network Attack and Defense Laboratory (□□□□□□□□□□□□□□□□□).'

Soochow University (□□□□)

Soochow University has been jointly supervised by the Jiangsu Provincial Government and defence

industry agency SASTIND since 2016. This arrangement is designed to expand the university's involvement in defense-related research and training.The university has five designated defence disciplines, centred around research on radiation. In particular, its School of Radiation Medicine and Protection has strong defence links, as it has become a major teaching and research base for the nuclear industry.Suzhou University is also involved in promoting military-civil fusion. The university cooperated with Changfeng Science Technology Industry Group (a subsidiary of missile manufacturer CASC) and Suzhou Xinkuan Electronic Technology Co., Ltd. to jointly establish the 'Suzhou University Military-Civil Fusion Internet of Things Collaborative Innovation Center.'

South China University of Technology (□□□□□□)

SCUT is subordinate to the Ministry of Education and in 2018 was placed under a joint-construction agreement between the MOE and SASTIND. This arrangement is designed to develop the university's involvement in defence-related research and training. SCUT also holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence technology projects. As a result of the university's placement under joint construction and its secret-level security credentials, SCUT's involvement in defence research is likely to grow in coming years.Since 2008, the university has hosted a defence research laboratory on materials science. The lab was initially run by the university's president. In 2017, the university joined the Guangzhou Civil-Military Integration Industry Coalition. More recently in 2019, SCUT and iFlytek established an artificial intelligence company, Guangzhou Huanan Naokong Zhineng Keji Gongsi (□□□□□□□□□□□□).

Southeast University (□□□□)

SEU is a leading Chinese university that engages in high levels of defence research. In 2015, the university undertook RMB180m (AUD37m) of defence research projects, placing it among the Ministry of Education universities most involved in defence research. That figure has almost certainly grown since 2016, when SEU came under a 'joint construction' agreement between the Ministry of Education and defence industry agency SASTIND. The university has secret security credentials, enabling it to participate in secret defence projects.The university has also been linked to cyberespionage. Researchers at its School of Cyber Science and Engineering (□□□□□□□□) have been funded by the MSS, China's civilian intelligence agency. The School of Cyber Science and Engineering has close ties to TopSec, a Chinese information security company that trains, recruits

and works with PLA cyber security officers.SEU states that its defence research relies on its excellence in electronics. It has at least two laboratories that specialise in defence research on navigation technology and underwater acoustics. Both laboratories may be involved in developing technology for underwater warfare. Representatives from the PLA Navy's Submarine Academy visited SEU in 2017.SEU has also built relationships with state-owned defence conglomerates. In 2017, the university signed a strategic cooperation agreement with missile-manufacturer China Aerospace Science and Industry Corporation. In 2018 and 2019, it signed similar agreements with subsidiaries of China Electronics Technology Group Corporation, China's leading manufacturer of military electronics.

Southwest University of Science and Technology (□□□□□□□)

SWUST is deeply engaged in defence research and is based in Mianyang, a city also home to China's nuclear weapons program and many other parts of the defence industry. Since 2006, the university has been subject to several joint construction agreements between the Sichuan Provincial Government and SASTIND that are designed to increase its involvement in defence research.SWUST carries out defence-related research on nuclear waste, radiation protection and electronic information engineering. It holds secret-level security credentials, allowing it to undertake classified defence technology and weapons projects. The university's main defence laboratory carries out research on topics such as the use of microorganisms to clean nuclear waste.SWUST has worked closely with the Chinese Academy of Engineering Physics (China's nuclear warheads program), China Aerodynamics Research and Development Center (a PLA base specialising in aircraft design), and defence conglomerates since its establishment. The fact that the university hosts the province's 'Civil-military Integration Institute' is a testament to its integration with the military and defence industry.

Space Engineering University (□□□□□□□□□□□□□□□□□□□□□□)

SEU was established in June 2017 as an expansion of the former PLA Equipment Academy (□□□□). SEU describes itself as a 'comprehensive university that trains talents for space command management and engineering.' It is intended to serve as the 'cradle of the new PLA's space talent

training.' The SEU is subordinate to and supports the PLA Strategic Support Force's Space Systems Department (□□□□□), which has taken over the space and potentially counterspace capabilities that were previously the purview of the former General Armaments Department and, to a lesser degree, the former General Staff Department.The SEU offers degree programs at the undergraduate, master's, and doctoral levels, as well as programs for non-commissioned officers, across disciplines including space target surveillance, remote sensing science and technology, and aerospace information security. Its faculty include nine CMC Science and Technology Commission experts and twenty professors who are designated as expert defence science and technology advisors.Beyond its mission of talent cultivation, the SEU also engages in extensive research. In particular, the SEU has a total of eighteen laboratories, which include two national-level key laboratories and one military-level key laboratory.

Sun Yat-sen University (□□□□)

SYSU is a leading Chinese university subordinate to the Ministry of Education. In 2018, it come under the joint supervision of MOE and defence industry agency SASTIND. This development indicates that SYSU's involvement in the defence industry and defence research is growing.The university has a large defence research budget. In 2018, it spent nearly RMB200 million (AUD41 million) on defence research out of its total research budget of RMB3.1 billion (AUD640 million).SYSU is linked to the Chinese military through its National Supercomputer Center in Guangzhou (□□□□□□□□□□□), which was placed on the US Government Entity List in 2015 for its role in nuclear weapons development. The centre was jointly established with the PLA National University of Defense Technology in 2011 to host the Tianhe-2 supercomputer. The supercomputer is operated by the National University of Defense Technology and was the world's fastest from 2013 to 2015.Aside from the supercomputer center, SYSU's Key Laboratory of Information Science is the only known lab focused on defence research and is located within the School of Electronics and Information Technology.In 2010, the university established a State Secrets Academy (□□□□□□),

serving as the third university in China to establish such an institute in partnership with China's National Administration of State Secrets Protection (□□□□□). The Institute carries out research and training on the protection of state secrets.

Tianjin Polytechnic University (□□□□□□)

TJPU is known for its research in the field of textile science and engineering. It is jointly supervised by the Ministry of Education and the city of Tianjin. In 2018, defence industry agency SASTIND and the Tianjin Municipal Government signed an agreement to jointly support TJPU. The purpose of the agreement is to support the university's development of defence disciplines, construction of defence laboratories, and training of defence scientists. Through this arrangement, SASTIND involves universities in military research projects and supports collaboration between universities and the defence industry. The university also holds secret-level security credentials that allow it to participate in classified defence technology projects.Tianjin Polytechnic University hosts one state key lab and two MOE key labs. One of the MOE key labs and the state key lab are located within the School of Material Science and Engineering. Additionally, TJPU's School of Textile Science and Engineering has conducted R&D that has been applied to industries in aerospace, defense, transportation, civil engineering, among others. The School of Textile Science and Engineering has reportedly become a backbone of research and innovation for China's textile industry.

Tianjin University (□□□□)

TJU is under the administration of the Ministry of Education and has also been supervised by defence industry agency SASTIND since 2012. The university has second-class security credentials, allowing it to participate in classified research projects at the level of 'secret'. It hosts two defence laboratories, working on optoelectronics and propellants.In 2015, A professor at Tianjin University was arrested by U.S. federal agents and accused of economic espionage and technology theft. He had been a professor in the School of Precision Instrument and Opto-electronics Engineering, which is home to one of the MOE labs involved in defense research. TJU is also a member of several international engineering alliances and has one National Defense Technology Innovation Team.TJU carries out research for the Ministry of State Security (MSS), China's civilian intelligence agency. It has hosted at least one MSS researcher and its scientists have been awarded for their work for the MSS on communication and information engineering.

Tongji University (□□□□)

Tongji University recognized for its work in architecture, civil engineering, marine geology, and transportation engineering. The university established the only state key laboratory of deep-sea geology, which plays an important role in China's deep-sea observation and serves as a significant platform for the country's marine strategy.The university's involvement in marine research likely stems from its joint construction with the State Oceanic Administration (SOA). In 2010, the Ministry of Education and the State Oceanic Administration signed to jointly establish 17 universities, a collaboration aimed at enhancing the ability to cultivate marine talents in universities, develop marine science and technology, and make contributions to the development of China's marine industry.Tongji University has secret-level security credentials and is home to one Ministry of Education laboratory dedicated to defense research. In April 2019, the university was placed on the U.S. Unverified List, which places restrictions on US exports to the university. Entities are added the Unverified List if the US Government is unable to satisfactorily carry out end-user checks on them to ensure compliance with export licenses.

Tsinghua University (□□□□)

Tsinghua University is considered China's leading university in science and technology. Often characterized as 'China's MIT,' Tsinghua is highly ranked globally, while also being the alma mater of numerous Chinese leaders, including Xi Jinping. Tsinghua has been included in numerous Chinese educational initiatives, including acting as a Class A institution in the Double First-Class University Plan and with membership in China's C9 League. As of spring 2018, Tsinghua University had 390 research institutions operating across a range of fields.Tsinghua engages in a range of military research and was awarded secret-level security credentials for classified research in 2007. In advancing military-civil fusion, Tsinghua also continues its 'fine tradition' of serving China's national security and defense, actively creating new platforms and initiatives to support this strategy. Not only its dedicated defence laboratories but also a range of key laboratories and research institutions at the university have received funding from the military. Since at least 2012, Tsinghua has also been jointly supervised by defence industry agency SASTIND as part of a program to deepen its defence research and links to the defence sector.Tsinghua's defence research covers areas such as artificial intelligence, air-to-air missiles, navigation technology, instrument science and materials science.The university trains students for China's nuclear weapons program, military and defence industry. In 2014 it signed a strategic cooperation agreement with the Chinese

Academy of Engineering Physics (CAEP)—China's nuclear weapons program. In 2016, CAEP's Materials Institute and Tsinghua established a joint postgraduate training base for teaching, research collaboration and equipment sharing.Approximately 200 postgraduate students at Tsinghua are sponsored by CAEP or defence industry conglomerates each year through the Chinese government's National Defence Science and Technology Scholarship program. Scholarship recipients are required to work for their sponsoring organisation for five years after graduating. Roughly 2000 of the scholarships are awarded each year, indicating that Tsinghua students are among the primary recipients of them. Documents published by Tsinghua indicate that CAEP planned to sponsor 40 PhD students to study nuclear technology in 2013. CAEP continues to sponsor Tsinghua postgraduates. In 2004, Tsinghua agreed to supervise doctoral students from the PLA's Second Artillery Engineering University, now known as the Rocket Force University of Engineering.

University of Electronic Science and Technology of China (□□□□□□)

UESTC was established in 1961 as one of China's first defence industry universities. It is now subordinate to the Ministry of Education (MOE) and is also jointly supervised by defence industry agencies MIIT and SASTIND, as well as the Chinese military's leading electronics manufacturer, China Electronics Technology Group Corporation (CETC).The university is one of China's leading universities for defence electronics research. It claims to rank among the top MOE universities in terms of the scale of its defence research. Between 2011 and 2015, its annual spending on defence research grew by 210% to RMB400 million (AUD80 million) and may account for as much as 32% of its overall research spending. 16.43% of UESTC graduates in 2017 who found employment were working in the defence sector. UESTC gained secret-level security credentials about a decade ago, probably in 2006, making it one of the first MOE universities to hold them.UESTC research has been used by state-owned manufacturers of military aircraft, missiles, and military electronics and the PLA Navy on projects such as the JF-17 fighter and the Navy's aircraft carrier program.UESTC's defence research covers areas including electronics, microwaves, terahertz technology, anti-jamming technology and signal processing, communication systems, military-use critical materials, optoelectric imaging. Between 2001 and 2005, UESTC undertook over 900 military electronics projects worth in excess of RMB500 million (AUD104 million).UESTC's research on artificial intelligence has attracted scrutiny for its human rights implications. In 2015, a professor recruited by UESTC through the Thousand Talents Plan established a company called Koala AI. The company produces artificial intelligence surveillance systems that are used in Xinjiang, where an estimated 1.5 million Uyghurs and other ethnic minorities have disappeared into concentration camps.UESTC has close relationships with the Chinese defence industry. The university operates a national laboratory on high-power radiation with the Chinese Academy of Engineering Physics, the PRC's primary nuclear warhead research complex. CETC, a state-owned defence conglomerate, partnered jointly with the MOE to developUESTC's capabilities. Under the arrangement, UESTC agreed to expand its collaboration with CETC, help train CETC personnel and send its best students to work at

CETC. Defence industry agency SASTIND also signed agreements to supervise UESTC in 2008 and 2016.

University of International Relations (□□□□□□)

UIR claims was established in 1949 under the direction of then Premier Zhou Enlai. In 1964 it was designated as a 'national key university', and this appears to be the evidence it uses to claim it is a Ministry of Education university. However, the university does not appear on the Ministry of Education's list of subordinate universities.Individuals formerly and presently affiliated with the university have also held affiliations with the MSS or the MSS-linked think tank the China Institutes of Contemporary International Relations (□□□□□□□□□□□□). They include Geng Huichang (□□□), a former Minister of State Security (2007-2016) and vice minister of State Security (1998-2007). Prior to this he was the head of China Institutes of Contemporary International Relations from 1992 to 1998. From 1990 to 1992, he was the director of UIR's American Research Department and from 1985-1990 he was deputy director of the American Research department. Notably, current UIR President Tao Jian is also a former CICIR vice-president and a UIR graduate.UIR gives the MSS a way to work with foreign universities and academics to shape and learn about perceptions of the PRC's views on security. It also provides a platform for the MSS to identify talent, recruit officers and collect intelligence.The university's Hangzhou campus, also known as the Zhejiang Second People's Police School, may carry out more practical training of MSS officers and has been described on a local government website as 'specialising in training special talent'. Some graduates of the Hangzhou campus have moved straight into MSS positions. The Hangzhou campus works closely with Zhejiang University on teaching and research.

University of Science and Technology of China (□□□□□□□□□)

The University of Science and Technology of China is among China's most prestigious universities in science and technology. Uniquely, it was established and is supervised by the Chinese Academy of Sciences, intended to serve national objectives in science and technology. Xi Jinping personally inspected USTC in 2016, urging it to pursue "even more outstanding achievements in teaching and innovation." It is a member of the C9 League and in the "211 Project" and "985 Project." While providing undergraduate and graduate-level education, USTC is also highly active in research across a number of major laboratories, including several that support research that is related to national defense and the development of dual-use technologies, such as brain-inspired approaches to artificial intelligence and quantum information science. USTC has a long history of contributions to science in the service of the state, and it has recently sought to deepen its contributions to military research, including through establishing a new center for military-civil fusion. Several USTC professors, including prominently Pan Jianwei, have partnered with the defense industry to pursue military applications of their technologies.

Xi’an University of Posts and Telecommunications (□□□□□□)

XUPT is a leading Chinese university supervised by the Shaanxi Provincial Government and the Department of Information Technology. The university was established in 1959 as an institution focused on communications and information technology. XUPT retains a focus on these discipline to this day. XUPT’s faculties include college focusing on artificial intelligence, automation, cyber security and electrical engineering.XUPT maintains close links to China’s Ministry of Public Security (MPS). The university has signed agreements and established joint laboratories with the MPS’s local counterparts.In November 2013, XUPT partnered with the Shaanxi Municipal Government’s public security ministry to establish the MPS Key Laboratory of Electronic Information Application Technology for Scene Investigation (□□□□□□□□□□□□□□□□□□□□). This was the first such joint laboratory that the MPS established with a university in any of China’s five north-western provinces.XUPT partnered with Xi’an’s Yanta District Public Security Bureau branch in November 2018, establishing the ‘Joint Laboratory for Smart Public Security Information Analysis and Applications’ (□□□□□□□□□□□□□□□□). The joint laboratory develops applications of artificial intelligence for analysing criminal information.

Xiamen University (□□□□)

XMU is one of China's leading universities, but it does not appear to engage in high levels of defence research. However, in 2018 it came under a joint supevision agreement between the Ministry of Education, the Fujian Provincial Government and defence industry agency SASTIND that indicates XMU will expand its involvement in defence research. The arrangement is designed to 'upgrade the university's ability to innovate defence science and technology and actively integrate itself with the development of military-civil fusion.'In 2017, XMU allegedly conspired with Huawei to steal trade secrets from CNEX Labs Inc., an American semiconductor startup. CNEX claims that Huawei and XMU engaged in a multiyear conspiracy to steal the company's solid-state drive computer storage technology.The university appears to be involved in the development of military-use heavy-duty coatings. In 2017, XMU, Fujian Normal University, Fujian Liheng Paint Co. Ltd. (□□□□□□□□□□) and People's Liberation Army Unit 63983 jointly established the Haixi Liheng New Materials Research Institute (□□□□□□□□□□). Fujian Liheng Paint specialises in heavy-duty coatings for warships and holds confidential-level security credentials, allowing it to participate in classified defence projects.

Xiangtan University (□□□□)

XTU is a university in Chairman Mao Zedong's hometown that has substantially expanded its participation in defence research in recent years. It has been subject to two 'joint construction' agreements between the Hunan Provincial Government and defence industry agency SASTIND that are designed to help the university 'draw out its national defence characteristics'. In the university's own words, its 'military-civil fusion characteristics are becoming clearer with each day', and it increased its spending on military-related projects by 60% from 2017 to 2018, spending over RMB31 million (AUD6 million) in 2018.XTU's defence research covers areas including materials science, energy, measurement technology and electromagnetic waves. The university has developed partnerships with a major PLA nuclear technology research institution, Northwest Institute of Nuclear Technology, and several defence companies, including subsidiaries of arms manufacturer Norinco Group and defence aviation conglomerate Aero Engine Corporation of China.XTU holds secret-level security credentials, allowing it to participate in classified defence technology projects.

Xidian University (□□□□□□□□)

Xidian Univeristy is among China's top universities for research on antennas, radar, electronic countermeasures and computer science. The university is subordinate to the Ministry of Education and is also jointly supervised by defence industry agency SASTIND and defence electronics conglomerate CETC. It claims it has 'made important contributions to military modernisation'.The university is closely tied to China's defense industry and the PLA. It runs at least five defence laboratories and partners with the PLA's signals intelligence organization. Xidian appears to be an important training ground for Chinese military hackers. According to Xidian's party secretary, the university has had an 'unbreakable bond with secret intelligence work since its beginning'. It also holds secret-level security credentials that allow it to work on classified weapons projects.

Yanshan University (□□□□)

The university was formed as an offshoot of Harbin Institute of Technology, one of China's top defence universities, in 1960. The university continues to prioritise defence research and is jointly supervised by the Hebei Provincial Government together with the Ministry of Education, Ministry of Industry and Information Technology and defence industry agency SASTIND.YSU's Defense Science and Technology Institute was established in 2006 under the support of COSTIND (a defence industry agency that has been replaced by SASTIND) to expand and oversee defence research at the university. The institute has driven the university's involvement in space-related defence research through the establishment of laboratories such as the Key Laboratory of Fundamental Science of Mechanical Structure and Materials Science Under Extreme Conditions. Four fields of research at YSU are officially designated as defence disciplines: control theory and control science, electrical circuits and systems, mechanical design and theory, and materials science and engineering.The university holds secret-level security credentials.

Yunnan Normal University (□□□□□□)

YNNU is a Chinese university subordinate to the Yunnan Provincial Government. Since 2013 it has also been supervised by the Ministry of Education. The university has been focused on training

teacher since its inception as the Kunming Teachers College (□□□□□□) in 1950. YNNU now has a broader focus on a variety of humanities, social and natural science disciplines.YNNU is organised into numerous faculties, some of which are relevant for communist party cadre training:

Zhejiang University (□□□□)

ZJU is subordinate to the Ministry of Education and jointly constructed with defence industry agency SASTIND. This arrangement with SASTIND began in 2016 and is designed to deepend the university's involvement in defence research. The university holds secret-level security credentials, allowing it to work on classified military projects.The university's total research funding amounts to RMB4.56 billion (AUD940 million) in 2018. It has at least three defence laboratories, with one source claiming that the university had ten key national laboratories (□□□□□□□) as of 2015. These laboratories are involved in research on computer simulations, high-performance computing and control science. The university also carries out cyber security research and receives funding for this work from the MSS, China's civilian intelligence agency.ZJU cooperates extensively with international universities and companies, with upwards of 40 international joint S&T research labs. The College of Electrical Engineering has joint labs with U.S. companies in key industries, such as Rockwell Automation in the field of information technology, and the National Semiconductor Corporation. Additionally, the university has a joint research lab with U.S company Microsoft.

Cryptominers

A list of cryptominer and cryptojacker malware..

Cryptominers is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Cisco Talos - raw-data

Lemon Duck

The infection starts with a PowerShell loading script, which is copied from other infected systems via SMB, email or external USB drives. The actor also employs several exploits for vulnerabilities such as SMBGhost and Eternal Blue.

The tag is: *misp-galaxy:cryptominers="Lemon Duck"*

Lemon Duck is also known as:

Table 993. Table References

Krane

The Krane malware uses SSH brute-force techniques to drop the XMRig cryptominer on the target to mine for the Hashvault pool.

The tag is: *misp-galaxy:cryptominers="Krane"*

Table 996. Table References

Links
https://cujo.com/threat-alert-krane-malware/

Hezb

“Hezb”, which is based on command line artifact data, was observed around Kinsing. This malware

is relatively new and was recently reported in late May exploiting WSO2 RCE (CVE-2022-29464) in the wild. Several malware components were observed, the first of which was an XMRig miner installed as “Hezb”. Additional modules included a polkit exploit for privilege escalation as well as a zero-detection ELF payload named “kik”.

The tag is: *misp-galaxy:cryptominers="Hezb"*

Countermeasures

DISARM is a framework designed for describing and understanding disinformation incidents..

Countermeasures is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

DISARM Project

Charge for social media

Include a paid-for privacy option, e.g. pay Facebook for an option of them not collecting your personal information. There are examples of this not working, e.g. most people don't use proton mail etc.

The tag is: *misp-galaxy:disarm-countermeasures="Charge for social media"*

Table 1031. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00006.md

Create shared fact-checking database

Share fact-checking resources - tips, responses, countermessages, across respose groups.

The tag is: *misp-galaxy:disarm-countermeasures="Create shared fact-checking database"*

Table 1032. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00008.md

Educate high profile influencers on best practices

Find online influencers. Provide training in the mechanisms of disinformation, how to spot campaigns, and/or how to contribute to responses by countermessaging, boosting information sites etc.

The tag is: *misp-galaxy:disarm-countermeasures="Educate high profile influencers on best practices"*

Table 1033. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00009.md

Enhanced privacy regulation for social media

Implement stronger privacy standards, to reduce the ability to microtarget community members.

The tag is: *misp-galaxy:disarm-countermeasures="Enhanced privacy regulation for social media"*

Table 1034. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00010.md

Media literacy. Games to identify fake news

Create and use games to show people the mechanics of disinformation, and how to counter them.

The tag is: *misp-galaxy:disarm-countermeasures="Media literacy. Games to identify fake news"*

Table 1035. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00011.md

Platform regulation

Empower existing regulators to govern social media. Also covers Destroy. Includes: Include the role of social media in the regulatory framework for media. The U.S. approach will need to be carefully crafted to protect First Amendment principles, create needed transparency, ensure liability, and impose costs for noncompliance. Includes Create policy that makes social media police disinformation. Includes: Use fraud legislation to clean up social media

The tag is: *misp-galaxy:disarm-countermeasures="Platform regulation"*

Table 1036. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00012.md

Rating framework for news

This is "strategic innoculation", raising the standards of what people expect in terms of evidence when consuming news. Example: journalistic ethics, or journalistic licencing body. Include full transcripts, link source, add items.

The tag is: *misp-galaxy:disarm-countermeasures="Rating framework for news"*

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00017.md

Reduce effect of division-enablers

includes Promote constructive communication by shaming division-enablers, and Promote playbooks to call out division-enablers

The tag is: *misp-galaxy:disarm-countermeasures="Reduce effect of division-enablers"*

Table 1041. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00019.md

Encourage in-person communication

Encourage offline communication

The tag is: *misp-galaxy:disarm-countermeasures="Encourage in-person communication"*

Table 1042. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00021.md

Innoculate. Positive campaign to promote feeling of safety

Used to counter ability based and fear based attacks

The tag is: *misp-galaxy:disarm-countermeasures="Innoculate. Positive campaign to promote feeling of safety"*

Table 1043. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00022.md

Promote healthy narratives

Includes promoting constructive narratives i.e. not polarising (e.g. pro-life, pro-choice, pro-USA). Includes promoting identity neutral narratives.

The tag is: *misp-galaxy:disarm-countermeasures="Promote healthy narratives"*

Table 1044. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00024.md

Shore up democracy based messages

Messages about e.g. peace, freedom. And make it sexy. Includes Deploy Information and Narrative-Building in Service of Statecraft: Promote a narrative of transparency, truthfulness, liberal values, and democracy. Implement a compelling narrative via effective mechanisms of communication. Continually reassess messages, mechanisms, and audiences over time. Counteract efforts to manipulate media, undermine free markets, and suppress political freedoms via public diplomacy

The tag is: *misp-galaxy:disarm-countermeasures="Shore up democracy based messages"*

Table 1045. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00026.md

Create culture of civility

This is passive. Includes promoting civility as an identity that people will defend.

The tag is: *misp-galaxy:disarm-countermeasures="Create culture of civility"*

Table 1046. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00027.md

Make information provenance available

Blockchain audit log and validation with collaborative decryption to post comments. Use blockchain technology to require collaborative validation before posts or comments are submitted. This could be used to adjust upvote weight via a trust factor of people and organisations you trust, or other criteria.

The tag is: *misp-galaxy:disarm-countermeasures="Make information provenance available"*

Table 1047. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00028.md

Create fake website to issue counter narrative and counter narrative through physical merchandise

Create websites in disinformation voids - spaces where people are looking for known disinformation.

The tag is: *misp-galaxy:disarm-countermeasures="Create fake website to issue counter narrative and counter narrative through physical merchandise"*

Table 1048. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00029.md

Develop a compelling counter narrative (truth based)

The tag is: *misp-galaxy:disarm-countermeasures="Develop a compelling counter narrative (truth based)"*

Table 1049. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00030.md

Dilute the core narrative - create multiple permutations, target / amplify

Create competing narratives. Included "Facilitate State Propaganda" as diluting the narrative could have an effect on the pro-state narrative used by volunteers, or lower their involvement.

The tag is: *misp-galaxy:disarm-countermeasures="Dilute the core narrative - create multiple permutations, target / amplify"*

Table 1050. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00031.md

Hijack content and link to truth- based info

Link to platform

The tag is: *misp-galaxy:disarm-countermeasures="Hijack content and link to truth- based info"*

Table 1051. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00032.md

Create more friction at account creation

Counters fake account

The tag is: *misp-galaxy:disarm-countermeasures="Create more friction at account creation"*

Table 1052. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00034.md

Infiltrate the in-group to discredit leaders (divide)

All of these would be highly affected by infiltration or false-claims of infiltration.

The tag is: *misp-galaxy:disarm-countermeasures="Infiltrate the in-group to discredit leaders (divide)"*

Table 1053. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00036.md

third party verification for people

counters fake experts

The tag is: *misp-galaxy:disarm-countermeasures="third party verification for people"*

Table 1054. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00040.md

Address truth contained in narratives

Focus on and boost truths in misinformation narratives, removing misinformation from them.

The tag is: *misp-galaxy:disarm-countermeasures="Address truth contained in narratives"*

Table 1055. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00042.md

Keep people from posting to social media immediately

Platforms can introduce friction to slow down activities, force a small delay between posts, or replies to posts.

The tag is: *misp-galaxy:disarm-countermeasures="Keep people from posting to social media immediately"*

Table 1056. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00044.md

Marginalise and discredit extremist groups

Reduce the credibility of extremist groups posting misinformation.

The tag is: *misp-galaxy:disarm-countermeasures="Marginalise and discredit extremist groups"*

Table 1057. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00046.md

Honeypot with coordinated inauthentics

Flood disinformation spaces with obviously fake content, to dilute core misinformation narratives in them.

The tag is: *misp-galaxy:disarm-countermeasures="Honeypot with coordinated inauthentics"*

Table 1058. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00047.md

Name and Shame Influencers

Think about the different levels: individual vs state-sponsored account. Includes “call them out”

and “name and shame”. Identify social media accounts as sources of propaganda—“calling them out”— might be helpful to prevent the spread of their message to audiences that otherwise would consider them factual. Identify, monitor, and, if necessary, target externally-based nonattributed social media accounts. Impact of and Dealing with Trolls - "Chatham House has observed that trolls also sometimes function as decoys, as a way of “keeping the infantry busy” that “aims to wear down the other side” (Lough et al., 2014). Another type of troll involves “false accounts posing as authoritative information sources on social media”.

The tag is: *misp-galaxy:disarm-countermeasures="Name and Shame Influencers"*

Table 1059. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00048.md

Counter social engineering training

Includes anti-elicitation training, phishing prevention education.

The tag is: *misp-galaxy:disarm-countermeasures="Counter social engineering training"*

Table 1060. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00051.md

Infiltrate platforms

Detect and degrade

The tag is: *misp-galaxy:disarm-countermeasures="Infiltrate platforms"*

Table 1061. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00052.md

Delete old accounts / Remove unused social media accounts

remove or remove access to (e.g. stop the ability to update) old social media accounts, to reduce the pool of accounts available for takeover, botnets etc.

The tag is: *misp-galaxy:disarm-countermeasures="Delete old accounts / Remove unused social media accounts"*

Table 1062. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00053.md

Encourage people to leave social media

Encourage people to leave spcial media. We don't expect this to work

The tag is: *misp-galaxy:disarm-countermeasures="Encourage people to leave social media"*

Table 1063. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00056.md

Report crowdfunder as violator

counters crowdfunding. Includes 'Expose online funding as fake".

The tag is: *misp-galaxy:disarm-countermeasures="Report crowdfunder as violator"*

Table 1064. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00058.md

Verification of project before posting fund requests

third-party verification of projects posting funding campaigns before those campaigns can be posted.

The tag is: *misp-galaxy:disarm-countermeasures="Verification of project before posting fund requests"*

Table 1065. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00059.md

Legal action against for-profit engagement factories

Take legal action against for-profit "factories" creating misinformation.

The tag is: *misp-galaxy:disarm-countermeasures="Legal action against for-profit engagement*

factories"

Table 1066. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00060.md

Free open library sources worldwide

Open-source libraries could be created that aid in some way for each technique. Even for Strategic Planning, some open-source frameworks such as DISARM can be created to counter the adversarial efforts.

The tag is: *misp-galaxy:disarm-countermeasures="Free open library sources worldwide"*

Table 1067. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00062.md

Reduce political targeting

Includes “ban political micro targeting” and “ban political ads”

The tag is: *misp-galaxy:disarm-countermeasures="Reduce political targeting"*

Table 1068. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00065.md

Co-opt a hashtag and drown it out (hijack it back)

Flood a disinformation-related hashtag with other content.

The tag is: *misp-galaxy:disarm-countermeasures="Co-opt a hashtag and drown it out (hijack it back)"*

Table 1069. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00066.md

Denigrate the recipient/ project (of online funding)

Reduce the credibility of groups behind misinformation-linked funding campaigns.

The tag is: *misp-galaxy:disarm-countermeasures="Denigrate the recipient/ project (of online funding)"*

Table 1070. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00067.md

Block access to disinformation resources

Resources = accounts, channels etc. Block access to platform. DDOS an attacker. TA02*: DDOS at the critical time, to deny an adversary's time-bound objective. T0008: A quick response to a proto-viral story will affect it's ability to spread and raise questions about their legitimacy. Hashtag: Against the platform, by drowning the hashtag. T0046 - Search Engine Optimisation: Sub-optimal website performance affect its search engine rank, which I interpret as "blocking access to a platform".

The tag is: *misp-galaxy:disarm-countermeasures="Block access to disinformation resources"*

Table 1071. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00070.md

Block source of pollution

Block websites, accounts, groups etc connected to misinformation and other information pollution.

The tag is: *misp-galaxy:disarm-countermeasures="Block source of pollution"*

Table 1072. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00071.md

Remove non-relevant content from special interest groups - not recommended

Check special-interest groups (e.g. medical, knitting) for unrelated and misinformation-linked content, and remove it.

The tag is: *misp-galaxy:disarm-countermeasures="Remove non-relevant content from special interest groups - not recommended"*

Table 1073. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00072.md

Inoculate populations through media literacy training

Use training to build the resilience of at-risk populations. Educate on how to handle info pollution. Push out targeted education on why it's pollution. Build cultural resistance to false content, e.g. cultural resistance to bullshit. Influence literacy training, to inoculate against "cult" recruiting. Media literacy training: leverage librarians / library for media literacy training. Inoculate at language. Strategic planning included as inoculating population has strategic value. Concepts of media literacy to a mass audience that authorities launch a public information campaign that teaches the programme will take time to develop and establish impact, recommends curriculum-based training. Covers detect, deny, and degrade.

The tag is: *misp-galaxy:disarm-countermeasures="Inoculate populations through media literacy training"*

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00073.md

Identify and delete or rate limit identical content

C00000

The tag is: *misp-galaxy:disarm-countermeasures="Identify and delete or rate limit identical content"*

Table 1075. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00074.md

normalise language

normalise the language around disinformation and misinformation; give people the words for artefact and effect types.

The tag is: *misp-galaxy:disarm-countermeasures="normalise language"*

Table 1076. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00075.md

Prohibit images in political discourse channels

Make political discussion channels text-only.

The tag is: *misp-galaxy:disarm-countermeasures="Prohibit images in political discourse channels"*

Table 1077. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00076.md

Active defence: run TA15 "develop people” - not recommended

Develop networks of communities and influencers around counter-misinformation. Match them to misinformation creators

The tag is: *misp-galaxy:disarm-countermeasures="Active defence: run TA15 "develop people” - not recommended"*

Table 1078. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00077.md

Change Search Algorithms for Disinformation Content

Includes “change image search algorithms for hate groups and extremists” and “Change search algorithms for hate and extremist queries to show content sympathetic to opposite side”

The tag is: *misp-galaxy:disarm-countermeasures="Change Search Algorithms for Disinformation Content"*

Table 1079. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00078.md

Create competing narrative

Create counternarratives, or narratives that compete in the same spaces as misinformation

narratives. Could also be degrade

The tag is: *misp-galaxy:disarm-countermeasures="Create competing narrative"*

Table 1080. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00080.md

Highlight flooding and noise, and explain motivations

Discredit by pointing out the "noise" and informing public that "flooding" is a technique of disinformation campaigns; point out intended objective of "noise"

The tag is: *misp-galaxy:disarm-countermeasures="Highlight flooding and noise, and explain motivations"*

Table 1081. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00081.md

Ground truthing as automated response to pollution

Also inoculation.

The tag is: *misp-galaxy:disarm-countermeasures="Ground truthing as automated response to pollution"*

Table 1082. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00082.md

Modify disinformation narratives, and rebroadcast them

Includes “poison pill recasting of message” and “steal their truths”. Many techniques involve promotion which could be manipulated. For example, online fundings or rallies could be advertised, through compromised or fake channels, as being associated with "far-up/down/left/right" actors. "Long Game" narratives could be subjected in a similar way with negative connotations. Can also replay technique T0003.

The tag is: *misp-galaxy:disarm-countermeasures="Modify disinformation narratives, and rebroadcast them"*

Table 1083. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00084.md

Mute content

Rate-limit disinformation content. Reduces its effects, whilst not running afoul of censorship concerns. Online archives of content (archives of websites, social media profiles, media, copies of published advertisements; or archives of comments attributed to bad actors, as well as anonymized metadata about users who interacted with them and analysis of the effect) is useful for intelligence analysis and public transparency, but will need similar muting or tagging/ shaming as associated with bad actors.

The tag is: *misp-galaxy:disarm-countermeasures="Mute content"*

Table 1084. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00085.md

Distract from noise with addictive content

Example: Interject addictive links or contents into discussions of disinformation materials and measure a "conversion rate" of users who engage with your content and away from the social media channel's "information bubble" around the disinformation item. Use bots to amplify and upvote the addictive content.

The tag is: *misp-galaxy:disarm-countermeasures="Distract from noise with addictive content"*

Table 1085. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00086.md

Make more noise than the disinformation

The tag is: *misp-galaxy:disarm-countermeasures="Make more noise than the disinformation"*

Table 1086. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00087.md

Fake engagement system

Create honeypots for misinformation creators to engage with, and reduce the resources they have available for misinformation campaigns.

The tag is: *misp-galaxy:disarm-countermeasures="Fake engagement system"*

Table 1087. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00090.md

Honeypot social community

Set honeypots, e.g. communities, in networks likely to be used for disinformation.

The tag is: *misp-galaxy:disarm-countermeasures="Honeypot social community"*

Table 1088. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00091.md

Establish a truth teller reputation score for influencers

Includes "Establish a truth teller reputation score for influencers” and “Reputation scores for social media users”. Influencers are individuals or accounts with many followers.

The tag is: *misp-galaxy:disarm-countermeasures="Establish a truth teller reputation score for influencers"*

Table 1089. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00092.md

Influencer code of conduct

Establish tailored code of conduct for individuals with many followers. Can be platform code of conduct; can also be community code.

The tag is: *misp-galaxy:disarm-countermeasures="Influencer code of conduct"*

Table 1090. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00093.md

Force full disclosure on corporate sponsor of research

Accountability move: make sure research is published with its funding sources.

The tag is: *misp-galaxy:disarm-countermeasures="Force full disclosure on corporate sponsor of research"*

Table 1091. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00094.md

Strengthen institutions that are always truth tellers

Increase credibility, visibility, and reach of positive influencers in the information space.

The tag is: *misp-galaxy:disarm-countermeasures="Strengthen institutions that are always truth tellers"*

Table 1092. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00096.md

Require use of verified identities to contribute to poll or comment

Reduce poll flooding by online taking comments or poll entries from verified accounts.

The tag is: *misp-galaxy:disarm-countermeasures="Require use of verified identities to contribute to poll or comment"*

Table 1093. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00097.md

Revocation of allowlisted or "verified" status

remove blue checkmarks etc from known misinformation accounts.

The tag is: *misp-galaxy:disarm-countermeasures="Revocation of allowlisted or "verified" status"*

Table 1094. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00098.md

Strengthen verification methods

Improve content veerification methods available to groups, individuals etc.

The tag is: *misp-galaxy:disarm-countermeasures="Strengthen verification methods"*

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00172.md

Create a healthier news environment

Free and fair press: create bipartisan, patriotic commitment to press freedom. Note difference between news and editorialising. Build alternative news sources: create alternative local-language news sources to counter local-language propaganda outlets. Delegitimize the 24 hour news cycle. includes Provide an alternative to disinformation content by expanding and improving local content: Develop content that can displace geopolitically-motivated narratives in the entire media environment, both new and old media alike.

The tag is: *misp-galaxy:disarm-countermeasures="Create a healthier news environment"*

Table 1147. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/counters/C00174.md

Improve Coordination amongst stakeholders: public and private

Coordinated disinformation challenges are increasingly multidisciplinary, there are few organisations within the national security structures that are equipped with the broad-spectrum capability to effectively counter large-scale conflict short of war tactics in real-time. Institutional hurdles currently impede diverse subject matter experts, hailing from outside of the traditional national security and foreign policy disciplines (e.g., physical science, engineering, media, legal, and economics fields), from contributing to the direct development of national security countermeasures to emerging conflict short of war threat vectors. A Cognitive Security Action Group (CSAG), akin to the Counterterrorism Security Group (CSG), could drive interagency alignment across equivalents of DHS, DoS, DoD, Intelligence Community, and other implementing agencies, in areas including strategic narrative, and the nexus of cyber and information operations.

The tag is: *misp-galaxy:disarm-countermeasures="Improve Coordination amongst stakeholders: public and private"*

Identify fence-sitters

Note: In each case, depending on the platform there may be a way to identify a fence-sitter. For example, online polls may have a neutral option or a "somewhat this-or-that" option, and may reveal who voted for that to all visitors. This information could be of use to data analysts. In TA08-11, the engagement level of victims could be identified to detect and respond to increasing engagement.

detection of a weak signal through global noise

Grey zone threats are challenging given that warning requires detection of a weak signal through global noise and across threat vectors and regional boundaries.Three interconnected grey zone elements characterise the nature of the activity: Temporality: The nature of grey zone threats truly requires a “big picture view” over long timescales and across regions and functional topics. Attribution: requiring an “almost certain” or “nearly certain analytic assessment before acting costs time and analytic effort Intent: judgement of adversarial intent to conduct grey zone activity. Indeed, the purpose of countering grey zone threats is to deter adversaries from fulfilling their intent to act. While attribution is one piece of the puzzle, closing the space around intent often means synthesising multiple relevant indicators and warnings, including the state’s geopolitical ambitions, military ties, trade and investment, level of corruption, and media landscape, among others.

The tag is: *misp-galaxy:disarm-detections="detection of a weak signal through global noise"*

Techniques

DISARM is a framework designed for describing and understanding disinformation incidents..

Techniques is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

DISARM Project

Facilitate State Propaganda

Organise citizens around pro-state messaging. Coordinate paid or volunteer groups to push state propaganda.

The tag is: *misp-galaxy:disarm-techniques="Facilitate State Propaganda"*

Table 1264. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0002.md

Leverage Existing Narratives

Use or adapt existing narrative themes, where narratives are the baseline stories of a target audience. Narratives form the bedrock of our worldviews. New information is understood through a process firmly grounded in this bedrock. If new information is not consitent with the prevailing narratives of an audience, it will be ignored. Effective campaigns will frame their misinformation in the context of these narratives. Highly effective campaigns will make extensive use of audience-appropriate archetypes and meta-narratives throughout their content creation and amplifiction practices.

The tag is: *misp-galaxy:disarm-techniques="Leverage Existing Narratives"*

Table 1265. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0003.md

Develop Competing Narratives

Advance competing narratives connected to same issue ie: on one hand deny incident while at same time expresses dismiss. Suppressing or discouraging narratives already spreading requires an alternative. The most simple set of narrative techniques in response would be the construction and promotion of contradictory alternatives centred on denial, deflection, dismissal, counter-charges, excessive standards of proof, bias in prohibition or enforcement, and so on. These competing narratives allow loyalists cover, but are less compelling to opponents and fence-sitters than campaigns built around existing narratives or highly explanatory master narratives. Competing narratives, as such, are especially useful in the "firehose of misinformation" approach.

The tag is: *misp-galaxy:disarm-techniques="Develop Competing Narratives"*

Table 1266. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0004.md

Create Inauthentic Social Media Pages and Groups

Create key social engineering assets needed to amplify content, manipulate algorithms, fool public and/or specific incident/campaign targets. Computational propaganda depends substantially on false perceptions of credibility and acceptance. By creating fake users and groups with a variety of interests and commitments, attackers can ensure that their messages both come from trusted sources and appear more widely adopted than they actually are.

The tag is: *misp-galaxy:disarm-techniques="Create Inauthentic Social Media Pages and Groups"*

Table 1267. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0007.md

Create Fake Experts

Stories planted or promoted in computational propaganda operations often make use of experts fabricated from whole cloth, sometimes specifically for the story itself.

The tag is: *misp-galaxy:disarm-techniques="Create Fake Experts"*

Table 1268. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0009.md

Utilise Academic/Pseudoscientific Justifications

Utilise Academic/Pseudoscientific Justifications

The tag is: *misp-galaxy:disarm-techniques="Utilise Academic/Pseudoscientific Justifications"*

Table 1269. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0009.001.md

Cultivate Ignorant Agents

Cultivate propagandists for a cause, the goals of which are not fully comprehended, and who are used cynically by the leaders of the cause. Independent actors use social media and specialised web

sites to strategically reinforce and spread messages compatible with their own. Their networks are infiltrated and used by state media disinformation organisations to amplify the state's own disinformation strategies against target populations. Many are traffickers in conspiracy theories or hoaxes, unified by a suspicion of Western governments and mainstream media. Their narratives, which appeal to leftists hostile to globalism and military intervention and nationalists against immigration, are frequently infiltrated and shaped by state-controlled trolls and altered news items from agencies such as RT and Sputnik. Also know as "useful idiots" or "unwitting agents".

The tag is: *misp-galaxy:disarm-techniques="Cultivate Ignorant Agents"*

Table 1270. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0010.md

Create Inauthentic Websites

Create media assets to support inauthentic organisations (e.g. think tank), people (e.g. experts) and/or serve as sites to distribute malware/launch phishing operations.

The tag is: *misp-galaxy:disarm-techniques="Create Inauthentic Websites"*

Table 1271. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0013.md

Prepare Fundraising Campaigns

Fundraising campaigns refer to an influence operation's systematic effort to seek financial support for a charity, cause, or other enterprise using online activities that further promote operation information pathways while raising a profit. Many influence operations have engaged in crowdfunding services on platforms including Tipee, Patreon, and GoFundMe. An operation may use its previously prepared fundraising campaigns (see: Develop Information Pathways) to promote operation messaging while raising money to support its activities.

The tag is: *misp-galaxy:disarm-techniques="Prepare Fundraising Campaigns"*

Table 1272. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0014.md

Raise Funds from Malign Actors

Raising funds from malign actors may include contributions from foreign agents, cutouts or proxies, shell companies, dark money groups, etc.

The tag is: *misp-galaxy:disarm-techniques="Raise Funds from Malign Actors"*

Table 1273. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0014.001.md

Raise Funds from Ignorant Agents

Raising funds from ignorant agents may include scams, donations intended for one stated purpose but then used for another, etc.

The tag is: *misp-galaxy:disarm-techniques="Raise Funds from Ignorant Agents"*

Table 1274. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0014.002.md

Create Hashtags and Search Artefacts

Create one or more hashtags and/or hashtag groups. Many incident-based campaigns will create hashtags to promote their fabricated event. Creating a hashtag for an incident can have two important effects: 1. Create a perception of reality around an event. Certainly only "real" events would be discussed in a hashtag. After all, the event has a name!, and 2. Publicise the story more widely through trending lists and search behaviour. Asset needed to direct/control/manage "conversation" connected to launching new incident/campaign with new hashtag for applicable social media sites).

The tag is: *misp-galaxy:disarm-techniques="Create Hashtags and Search Artefacts"*

Table 1275. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0015.md

Create Clickbait

Create attention grabbing headlines (outrage, doubt, humour) required to drive traffic & engagement. This is a key asset.

The tag is: *misp-galaxy:disarm-techniques="Create Clickbait"*

Table 1276. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0016.md

Conduct Fundraising

Fundraising campaigns refer to an influence operation's systematic effort to seek financial support for a charity, cause, or other enterprise using online activities that further promote operation information pathways while raising a profit. Many influence operations have engaged in crowdfunding services166 on platforms including Tipee, Patreon, and GoFundMe. An operation may use its previously prepared fundraising campaigns to promote operation messaging while raising money to support its activities.

The tag is: *misp-galaxy:disarm-techniques="Conduct Fundraising"*

Table 1277. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0017.md

Conduct Crowdfunding Campaigns

An influence operation may Conduct Crowdfunding Campaigns on platforms such as GoFundMe, GiveSendGo, Tipeee, Patreon, etc.

The tag is: *misp-galaxy:disarm-techniques="Conduct Crowdfunding Campaigns"*

Table 1278. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0017.001.md

Purchase Targeted Advertisements

Create or fund advertisements targeted at specific populations

The tag is: *misp-galaxy:disarm-techniques="Purchase Targeted Advertisements"*

Table 1279. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0018.md

Trial Content

Iteratively test incident performance (messages, content etc), e.g. A/B test headline/content enagagement metrics; website and/or funding campaign conversion rates

The tag is: *misp-galaxy:disarm-techniques="Trial Content"*

Table 1280. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0020.md

Leverage Conspiracy Theory Narratives

"Conspiracy narratives" appeal to the human desire for explanatory order, by invoking the participation of poweful (often sinister) actors in pursuit of their own political goals. These narratives are especially appealing when an audience is low-information, marginalised or otherwise inclined to reject the prevailing explanation. Conspiracy narratives are an important component of the "firehose of falsehoods" model.

The tag is: *misp-galaxy:disarm-techniques="Leverage Conspiracy Theory Narratives"*

Table 1281. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0022.md

Amplify Existing Conspiracy Theory Narratives

An influence operation may amplify an existing conspiracy theory narrative that aligns with its incident or campaign goals. By amplifying existing conspiracy theory narratives, operators can leverage the power of the existing communities that support and propagate those theories without needing to expend resources creating new narratives or building momentum and buy in around new narratives.

The tag is: *misp-galaxy:disarm-techniques="Amplify Existing Conspiracy Theory Narratives"*

Table 1282. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0022.001.md

Develop Original Conspiracy Theory Narratives

While this requires more resources than amplifying existing conspiracy theory narratives, an influence operation may develop original conspiracy theory narratives in order to achieve greater control and alignment over the narrative and their campaign goals. Prominent examples include the USSR's Operation INFEKTION disinformation campaign run by the KGB in the 1980s to plant the idea that the United States had invented HIV/AIDS as part of a biological weapons research project at Fort Detrick, Maryland. More recently, Fort Detrick featured prominently in a new conspiracy theory narratives around the origins of the COVID-19 outbreak and pandemic.

The tag is: *misp-galaxy:disarm-techniques="Develop Original Conspiracy Theory Narratives"*

Table 1283. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0022.002.md

Distort Facts

Change, twist, or exaggerate existing facts to construct a narrative that differs from reality. Examples: images and ideas can be distorted by being placed in an improper content

The tag is: *misp-galaxy:disarm-techniques="Distort Facts"*

Table 1284. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0023.md

Reframe Context

Reframing context refers to removing an event from its surrounding context to distort its intended meaning. Rather than deny that an event occurred, reframing context frames an event in a manner that may lead the target audience to draw a different conclusion about its intentions.

The tag is: *misp-galaxy:disarm-techniques="Reframe Context"*

Table 1285. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0023.001.md

Edit Open-Source Content

An influence operation may edit open-source content, such as collaborative blogs or

encyclopaedias, to promote its narratives on outlets with existing credibility and audiences. Editing open-source content may allow an operation to post content on platforms without dedicating resources to the creation and maintenance of its own assets.

The tag is: *misp-galaxy:disarm-techniques="Edit Open-Source Content"*

Table 1286. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0023.002.md

Online Polls

Create fake online polls, or manipulate existing online polls. Data gathering tactic to target those who engage, and potentially their networks of friends/followers as well

The tag is: *misp-galaxy:disarm-techniques="Online Polls"*

Table 1287. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0029.md

Bait Influencer

Influencers are people on social media platforms who have large audiences.

Threat Actors can try to trick Influencers such as celebrities, journalists, or local leaders who aren't associated with their campaign into amplifying campaign content. This gives them access to the Influencer's audience without having to go through the effort of building it themselves, and it helps legitimise their message by associating it with the Influencer, benefitting from their audience's trust in them.

The tag is: *misp-galaxy:disarm-techniques="Bait Influencer"*

Table 1288. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0039.md

Demand Insurmountable Proof

Campaigns often leverage tactical and informational asymmetries on the threat surface, as seen in the Distort and Deny strategies, and the "firehose of misinformation". Specifically, conspiracy theorists can be repeatedly wrong, but advocates of the truth need to be perfect. By constantly

escalating demands for proof, propagandists can effectively leverage this asymmetry while also priming its future use, often with an even greater asymmetric advantage. The conspiracist is offered freer rein for a broader range of "questions" while the truth teller is burdened with higher and higher standards of proof.

The tag is: *misp-galaxy:disarm-techniques="Demand Insurmountable Proof"*

Table 1289. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0040.md

Seed Kernel of Truth

Wrap lies or altered context/facts around truths. Influence campaigns pursue a variety of objectives with respect to target audiences, prominent among them: 1. undermine a narrative commonly referenced in the target audience; or 2. promote a narrative less common in the target audience, but preferred by the attacker. In both cases, the attacker is presented with a heavy lift. They must change the relative importance of various narratives in the interpretation of events, despite contrary tendencies. When messaging makes use of factual reporting to promote these adjustments in the narrative space, they are less likely to be dismissed out of hand; when messaging can juxtapose a (factual) truth about current affairs with the (abstract) truth explicated in these narratives, propagandists can undermine or promote them selectively. Context matters.

The tag is: *misp-galaxy:disarm-techniques="Seed Kernel of Truth"*

Table 1290. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0042.md

Chat Apps

Direct messaging via chat app is an increasing method of delivery. These messages are often automated and new delivery and storage methods make them anonymous, viral, and ephemeral. This is a difficult space to monitor, but also a difficult space to build acclaim or notoriety.

The tag is: *misp-galaxy:disarm-techniques="Chat Apps"*

Table 1291. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0043.md

Use Encrypted Chat Apps

Examples include Signal, WhatsApp, Discord, Wire, etc.

The tag is: *misp-galaxy:disarm-techniques="Use Encrypted Chat Apps"*

Table 1292. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0043.001.md

Use Unencrypted Chats Apps

Examples include SMS, etc.

The tag is: *misp-galaxy:disarm-techniques="Use Unencrypted Chats Apps"*

Table 1293. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0043.002.md

Seed Distortions

Try a wide variety of messages in the early hours surrounding an incident or event, to give a misleading account or impression.

The tag is: *misp-galaxy:disarm-techniques="Seed Distortions"*

Table 1294. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0044.md

Use Fake Experts

Use the fake experts that were set up during Establish Legitimacy. Pseudo-experts are disposable assets that often appear once and then disappear. Give "credility" to misinformation. Take advantage of credential bias

The tag is: *misp-galaxy:disarm-techniques="Use Fake Experts"*

Table 1295. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0045.md

Use Search Engine Optimisation

Manipulate content engagement metrics (ie: Reddit & Twitter) to influence/impact news search results (e.g. Google), also elevates RT & Sputnik headline into Google news alert emails. aka "Black-hat SEO"

The tag is: *misp-galaxy:disarm-techniques="Use Search Engine Optimisation"*

Table 1296. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0046.md

Censor Social Media as a Political Force

Use political influence or the power of state to stop critical social media comments. Government requested/driven content take downs (see Google Transperancy reports).

The tag is: *misp-galaxy:disarm-techniques="Censor Social Media as a Political Force"*

Table 1297. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0047.md

Harass

Threatening or harassing believers of opposing narratives refers to the use of intimidation techniques, including cyberbullying and doxing, to discourage opponents from voicing their dissent. An influence operation may threaten or harass believers of the opposing narratives to deter individuals from posting or proliferating conflicting content.

The tag is: *misp-galaxy:disarm-techniques="Harass"*

Table 1298. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0048.md

Boycott/"Cancel" Opponents

Cancel culture refers to the phenomenon in which individuals collectively refrain from supporting an individual, organisation, business, or other entity, usually following a real or falsified controversy. An influence operation may exploit cancel culture by emphasising an adversary's problematic or disputed behaviour and presenting its own content as an alternative.

The tag is: *misp-galaxy:disarm-techniques="Boycott/"Cancel" Opponents"*

Table 1299. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0048.001.md

Harass People Based on Identities

Examples include social identities like gender, sexuality, race, ethnicity, religion, ability, nationality, etc. as well as roles and occupations like journalist or activist.

The tag is: *misp-galaxy:disarm-techniques="Harass People Based on Identities"*

Table 1300. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0048.002.md

Threaten to Dox

Doxing refers to online harassment in which individuals publicly release private information about another individual, including names, addresses, employment information, pictures, family members, and other sensitive information. An influence operation may dox its opposition to encourage individuals aligned with operation narratives to harass the doxed individuals themselves or otherwise discourage the doxed individuals from posting or proliferating conflicting content.

The tag is: *misp-galaxy:disarm-techniques="Threaten to Dox"*

Table 1301. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0048.003.md

Dox

Doxing refers to online harassment in which individuals publicly release private information about

another individual, including names, addresses, employment information, pictures, family members, and other sensitive information. An influence operation may dox its opposition to encourage individuals aligned with operation narratives to harass the doxed individuals themselves or otherwise discourage the doxed individuals from posting or proliferating conflicting content.

The tag is: *misp-galaxy:disarm-techniques="Dox"*

Table 1302. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0048.004.md

Flood Information Space

Flooding sources of information (e.g. Social Media feeds) with a high volume of inauthentic content.

This can be done to control/shape online conversations, drown out opposing points of view, or make it harder to find legitimate information.

Bots and/or patriotic trolls are effective tools to achieve this effect.

This Technique previously used the name Flooding the Information Space.

The tag is: *misp-galaxy:disarm-techniques="Flood Information Space"*

Table 1303. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0049.md

Trolls Amplify and Manipulate

Use trolls to amplify narratives and/or manipulate narratives. Fake profiles/sockpuppets operating to support individuals/narratives from the entire political spectrum (left/right binary). Operating with increased emphasis on promoting local content and promoting real Twitter users generating their own, often divisive political content, as it's easier to amplify existing content than create new/original content. Trolls operate where ever there's a socially divisive issue (issues that can/are be politicized).

The tag is: *misp-galaxy:disarm-techniques="Trolls Amplify and Manipulate"*

Table 1304. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0049.001.md

Flood Existing Hashtag

Hashtags can be used by communities to collate information they post about particular topics (such as their interests, or current events) and users can find communities to join by exploring hashtags they're interested in.

Threat actors can flood an existing hashtag to try to ruin hashtag functionality, posting content unrelated to the hashtag alongside it, making it a less reliable source of relevant information. They may also try to flood existing hashtags with campaign content, with the intent of maximising exposure to users.

This Technique covers cases where threat actors flood existing hashtags with campaign content.

This Technique covers behaviours previously documented by T0019.002: Hijack Hashtags, which has since been deprecated. This Technique was previously called Hijack Existing Hashtag.

The tag is: *misp-galaxy:disarm-techniques="Flood Existing Hashtag"*

Table 1305. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0049.002.md

Bots Amplify via Automated Forwarding and Reposting

Automated forwarding and reposting refer to the proliferation of operation content using automated means, such as artificial intelligence or social media bots. An influence operation may use automated activity to increase content exposure without dedicating the resources, including personnel and time, traditionally required to forward and repost content. Use bots to amplify narratives above algorithm thresholds. Bots are automated/programmed profiles designed to amplify content (ie: automatically retweet or like) and give appearance it's more "popular" than it is. They can operate as a network, to function in a coordinated/orchestrated manner. In some cases (more so now) they are an inexpensive/disposable assets used for minimal deployment as bot detection tools improve and platforms are more responsive.

The tag is: *misp-galaxy:disarm-techniques="Bots Amplify via Automated Forwarding and Reposting"*

Table 1306. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0049.003.md

Utilise Spamoflauge

Spamoflauge refers to the practice of disguising spam messages as legitimate. Spam refers to the

use of electronic messaging systems to send out unrequested or unwanted messages in bulk. Simple methods of spamoflauge include replacing letters with numbers to fool keyword-based email spam filters, for example, "you've w0n our jackp0t!". Spamoflauge may extend to more complex techniques such as modifying the grammar or word choice of the language, casting messages as images which spam detectors cannot automatically read, or encapsulating messages in password protected attachments, such as .pdf or .zip files. Influence operations may use spamoflauge to avoid spam filtering systems and increase the likelihood of the target audience receiving operation messaging.

The tag is: *misp-galaxy:disarm-techniques="Utilise Spamoflauge"*

Table 1307. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0049.004.md

Conduct Swarming

Swarming refers to the coordinated use of accounts to overwhelm the information space with operation content. Unlike information flooding, swarming centres exclusively around a specific event or actor rather than a general narrative. Swarming relies on "horizontal communication" between information assets rather than a top-down, vertical command-and-control approach.

The tag is: *misp-galaxy:disarm-techniques="Conduct Swarming"*

Table 1308. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0049.005.md

Conduct Keyword Squatting

Keyword squatting refers to the creation of online content, such as websites, articles, or social media accounts, around a specific search engine-optimized term to overwhelm the search results of that term. An influence may keyword squat to increase content exposure to target audience members who query the exploited term in a search engine and manipulate the narrative around the term.

The tag is: *misp-galaxy:disarm-techniques="Conduct Keyword Squatting"*

Table 1309. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0049.006.md

Inauthentic Sites Amplify News and Narratives

Inauthentic sites circulate cross-post stories and amplify narratives. Often these sites have no masthead, bylines or attribution.

The tag is: *misp-galaxy:disarm-techniques="Inauthentic Sites Amplify News and Narratives"*

Table 1310. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0049.007.md

Generate Information Pollution

Information Pollution occurs when threat actors attempt to ruin a source of information by flooding it with lots of inauthentic or unreliable content, intending to make it harder for legitimate users to find the information they're looking for.

This subtechnique's objective is to reduce exposure to target information, rather than promoting exposure to campaign content, for which the parent technique T0049 can be used.

Analysts will need to infer what the motive for flooding an information space was when deciding whether to use T0049 or T0049.008 to tag a case when an information space is flooded. If such inference is not possible, default to T0049.

This Technique previously used the ID T0019.

The tag is: *misp-galaxy:disarm-techniques="Generate Information Pollution"*

Table 1311. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0049.008.md

Organise Events

Coordinate and promote real-world events across media platforms, e.g. rallies, protests, gatherings in support of incident narratives.

The tag is: *misp-galaxy:disarm-techniques="Organise Events"*

Table 1312. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0057.md

Pay for Physical Action

Paying for physical action occurs when an influence operation pays individuals to act in the physical realm. An influence operation may pay for physical action to create specific situations and frame them in a way that supports operation narratives, for example, paying a group of people to burn a car to later post an image of the burning car and frame it as an act of protest.

The tag is: *misp-galaxy:disarm-techniques="Pay for Physical Action"*

Table 1313. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0057.001.md

Conduct Symbolic Action

Symbolic action refers to activities specifically intended to advance an operation's narrative by signalling something to the audience, for example, a military parade supporting a state's narrative of military superiority. An influence operation may use symbolic action to create falsified evidence supporting operation narratives in the physical information space.

The tag is: *misp-galaxy:disarm-techniques="Conduct Symbolic Action"*

Table 1314. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0057.002.md

Play the Long Game

Play the long game refers to two phenomena: 1. To plan messaging and allow it to grow organically without conducting your own amplification. This is methodical and slow and requires years for the message to take hold 2. To develop a series of seemingly disconnected messaging narratives that eventually combine into a new narrative.

The tag is: *misp-galaxy:disarm-techniques="Play the Long Game"*

Table 1315. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0059.md

Continue to Amplify

continue narrative or message amplification after the main incident work has finished

The tag is: *misp-galaxy:disarm-techniques="Continue to Amplify"*

Table 1316. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0060.md

Sell Merchandise

Sell mechandise refers to getting the message or narrative into physical space in the offline world while making money

The tag is: *misp-galaxy:disarm-techniques="Sell Merchandise"*

Table 1317. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0061.md

Prepare Physical Broadcast Capabilities

Create or coopt broadcast capabilities (e.g. TV, radio etc).

The tag is: *misp-galaxy:disarm-techniques="Prepare Physical Broadcast Capabilities"*

Table 1318. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0065.md

Degrade Adversary

Plan to degrade an adversary's image or ability to act. This could include preparation and use of harmful information about the adversary's actions or reputation.

The tag is: *misp-galaxy:disarm-techniques="Degrade Adversary"*

Table 1319. Table References

Links

Segment Audiences

Create audience segmentations by features of interest to the influence campaign, including political affiliation, geographic location, income, demographics, and psychographics.

The tag is: *misp-galaxy:disarm-techniques="Segment Audiences"*

Table 1321. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0072.md

Geographic Segmentation

An influence operation may target populations in a specific geographic location, such as a region, state, or city. An influence operation may use geographic segmentation to Create Localised Content (see: Establish Legitimacy).

The tag is: *misp-galaxy:disarm-techniques="Geographic Segmentation"*

Table 1322. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0072.001.md

Demographic Segmentation

An influence operation may target populations based on demographic segmentation, including age, gender, and income. Demographic segmentation may be useful for influence operations aiming to change state policies that affect a specific population sector. For example, an influence operation attempting to influence Medicare funding in the United States would likely target U.S. voters over 65 years of age.

The tag is: *misp-galaxy:disarm-techniques="Demographic Segmentation"*

Table 1323. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0072.002.md

Economic Segmentation

An influence operation may target populations based on their income bracket, wealth, or other financial or economic division.

The tag is: *misp-galaxy:disarm-techniques="Economic Segmentation"*

Table 1324. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0072.003.md

Psychographic Segmentation

An influence operation may target populations based on psychographic segmentation, which uses audience values and decision-making processes. An operation may individually gather psychographic data with its own surveys or collection tools or externally purchase data from social media companies or online surveys, such as personality quizzes.

The tag is: *misp-galaxy:disarm-techniques="Psychographic Segmentation"*

Table 1325. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0072.004.md

Political Segmentation

An influence operation may target populations based on their political affiliations, especially when aiming to manipulate voting or change policy.

The tag is: *misp-galaxy:disarm-techniques="Political Segmentation"*

Table 1326. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0072.005.md

Determine Target Audiences

Determining the target audiences (segments of the population) who will receive campaign narratives and artefacts intended to achieve the strategic ends.

The tag is: *misp-galaxy:disarm-techniques="Determine Target Audiences"*

Table 1327. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0073.md

Determine Strategic Ends

These are the long-term end-states the campaign aims to bring about. They typically involve an advantageous position vis-a-vis competitors in terms of power or influence. The strategic goal may be to improve or simply to hold one's position. Competition occurs in the public sphere in the domains of war, diplomacy, politics, economics, and ideology, and can play out between armed groups, nation-states, political parties, corporations, interest groups, or individuals.

The tag is: *misp-galaxy:disarm-techniques="Determine Strategic Ends"*

Table 1328. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0074.md

Geopolitical Advantage

Favourable position on the international stage in terms of great power politics or regional rivalry. Geopolitics plays out in the realms of foreign policy, national security, diplomacy, and intelligence. It involves nation-state governments, heads of state, foreign ministers, intergovernmental organisations, and regional security alliances.

The tag is: *misp-galaxy:disarm-techniques="Geopolitical Advantage"*

Table 1329. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0074.001.md

Domestic Political Advantage

Favourable position vis-à-vis national or sub-national political opponents such as political parties, interest groups, politicians, candidates.

The tag is: *misp-galaxy:disarm-techniques="Domestic Political Advantage"*

Table 1330. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0074.002.md

Economic Advantage

Favourable position domestically or internationally in the realms of commerce, trade, finance, industry. Economics involves nation-states, corporations, banks, trade blocs, industry associations, cartels.

The tag is: *misp-galaxy:disarm-techniques="Economic Advantage"*

Table 1331. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0074.003.md

Ideological Advantage

Favourable position domestically or internationally in the market for ideas, beliefs, and world views. Competition plays out among faith systems, political systems, and value systems. It can involve sub-national, national or supra-national movements.

The tag is: *misp-galaxy:disarm-techniques="Ideological Advantage"*

Table 1332. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0074.004.md

Dismiss

Push back against criticism by dismissing your critics. This might be arguing that the critics use a different standard for you than with other actors or themselves; or arguing that their criticism is biassed.

The tag is: *misp-galaxy:disarm-techniques="Dismiss"*

Table 1333. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0075.md

Discredit Credible Sources

Plan to delegitimize the media landscape and degrade public trust in reporting, by discrediting credible sources. This makes it easier to promote influence operation content.

The tag is: *misp-galaxy:disarm-techniques="Discredit Credible Sources"*

Table 1334. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0075.001.md

Distort

Twist the narrative. Take information, or artefacts like images, and change the framing around them.

The tag is: *misp-galaxy:disarm-techniques="Distort"*

Table 1335. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0076.md

Distract

Shift attention to a different narrative or actor, for instance by accusing critics of the same activity that they've accused you of (e.g. police brutality).

The tag is: *misp-galaxy:disarm-techniques="Distract"*

Table 1336. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0077.md

Dismay

Threaten the critic or narrator of events. For instance, threaten journalists or news outlets reporting on a story.

The tag is: *misp-galaxy:disarm-techniques="Dismay"*

Table 1337. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0078.md

Divide

Create conflict between subgroups, to widen divisions in a community

The tag is: *misp-galaxy:disarm-techniques="Divide"*

Table 1338. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0079.md

Map Target Audience Information Environment

Mapping the target audience information environment analyses the information space itself, including social media analytics, web traffic, and media surveys. Mapping the information environment may help the influence operation determine the most realistic and popular information channels to reach its target audience. Mapping the target audience information environment aids influence operations in determining the most vulnerable areas of the information space to target with messaging.

The tag is: *misp-galaxy:disarm-techniques="Map Target Audience Information Environment"*

Table 1339. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0080.md

Monitor Social Media Analytics

An influence operation may use social media analytics to determine which factors will increase the operation content's exposure to its target audience on social media platforms, including views, interactions, and sentiment relating to topics and content types. The social media platform itself or a third-party tool may collect the metrics.

The tag is: *misp-galaxy:disarm-techniques="Monitor Social Media Analytics"*

Table 1340. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0080.001.md

Evaluate Media Surveys

An influence operation may evaluate its own or third-party media surveys to determine what type of content appeals to its target audience. Media surveys may provide insight into an audience's political views, social class, general interests, or other indicators used to tailor operation messaging to its target audience.

The tag is: *misp-galaxy:disarm-techniques="Evaluate Media Surveys"*

Table 1341. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0080.002.md

Identify Trending Topics/Hashtags

An influence operation may identify trending hashtags on social media platforms for later use in boosting operation content. A hashtag40 refers to a word or phrase preceded by the hash symbol (#) on social media used to identify messages and posts relating to a specific topic. All public posts that use the same hashtag are aggregated onto a centralised page dedicated to the word or phrase and sorted either chronologically or by popularity.

The tag is: *misp-galaxy:disarm-techniques="Identify Trending Topics/Hashtags"*

Table 1342. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0080.003.md

Conduct Web Traffic Analysis

An influence operation may conduct web traffic analysis to determine which search engines, keywords, websites, and advertisements gain the most traction with its target audience.

The tag is: *misp-galaxy:disarm-techniques="Conduct Web Traffic Analysis"*

Table 1343. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0080.004.md

Assess Degree/Type of Media Access

An influence operation may survey a target audience's Internet availability and degree of media freedom to determine which target audience members will have access to operation content and on which platforms. An operation may face more difficulty targeting an information environment with heavy restrictions and media control than an environment with independent media, freedom of speech and of the press, and individual liberties.

The tag is: *misp-galaxy:disarm-techniques="Assess Degree/Type of Media Access"*

Table 1344. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0080.005.md

Identify Social and Technical Vulnerabilities

Identifying social and technical vulnerabilities determines weaknesses within the target audience information environment for later exploitation. Vulnerabilities include decisive political issues, weak cybersecurity infrastructure, search engine data voids, and other technical and non technical weaknesses in the target information environment. Identifying social and technical vulnerabilities facilitates the later exploitation of the identified weaknesses to advance operation objectives.

The tag is: *misp-galaxy:disarm-techniques="Identify Social and Technical Vulnerabilities"*

Table 1345. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0081.md

Find Echo Chambers

Find or plan to create areas (social media groups, search term groups, hashtag groups etc) where individuals only engage with people they agree with.

The tag is: *misp-galaxy:disarm-techniques="Find Echo Chambers"*

Table 1346. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0081.001.md

Identify Data Voids

A data void refers to a word or phrase that results in little, manipulative, or low-quality search

engine data. Data voids are hard to detect and relatively harmless until exploited by an entity aiming to quickly proliferate false or misleading information during a phenomenon that causes a high number of individuals to query the term or phrase. In the Plan phase, an influence operation may identify data voids for later exploitation in the operation. A 2019 report by Michael Golebiewski identifies five types of data voids. (1) “Breaking news” data voids occur when a keyword gains popularity during a short period of time, allowing an influence operation to publish false content before legitimate news outlets have an opportunity to publish relevant information. (2) An influence operation may create a “strategic new terms” data void by creating their own terms and publishing information online before promoting their keyword to the target audience. (3) An influence operation may publish content on “outdated terms” that have decreased in popularity, capitalising on most search engines’ preferences for recency. (4) “Fragmented concepts” data voids separate connections between similar ideas, isolating segment queries to distinct search engine results. (5) An influence operation may use “problematic queries” that previously resulted in disturbing or inappropriate content to promote messaging until mainstream media recontextualizes the term.

The tag is: *misp-galaxy:disarm-techniques="Identify Data Voids"*

Table 1347. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0081.002.md

Identify Existing Prejudices

An influence operation may exploit existing racial, religious, demographic, or social prejudices to further polarise its target audience from the rest of the public.

The tag is: *misp-galaxy:disarm-techniques="Identify Existing Prejudices"*

Table 1348. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0081.003.md

Identify Existing Fissures

An influence operation may identify existing fissures to pit target populations against one another or facilitate a “divide-and-conquer" approach to tailor operation narratives along the divides.

The tag is: *misp-galaxy:disarm-techniques="Identify Existing Fissures"*

Table 1349. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0081.004.md

Identify Existing Conspiracy Narratives/Suspicions

An influence operation may assess preexisting conspiracy theories or suspicions in a population to identify existing narratives that support operational objectives.

The tag is: *misp-galaxy:disarm-techniques="Identify Existing Conspiracy Narratives/Suspicions"*

Table 1350. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0081.005.md

Identify Wedge Issues

A wedge issue is a divisive political issue, usually concerning a social phenomenon, that divides individuals along a defined line. An influence operation may exploit wedge issues by intentionally polarising the public along the wedge issue line and encouraging opposition between factions.

The tag is: *misp-galaxy:disarm-techniques="Identify Wedge Issues"*

Table 1351. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0081.006.md

Identify Target Audience Adversaries

An influence operation may identify or create a real or imaginary adversary to centre operation narratives against. A real adversary may include certain politicians or political parties while imaginary adversaries may include falsified “deep state”62 actors that, according to conspiracies, run the state behind public view.

The tag is: *misp-galaxy:disarm-techniques="Identify Target Audience Adversaries"*

Table 1352. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0081.007.md

Identify Media System Vulnerabilities

An influence operation may exploit existing weaknesses in a target's media system. These weaknesses may include existing biases among media agencies, vulnerability to false news agencies on social media, or existing distrust of traditional media sources. An existing distrust among the public in the media system's credibility holds high potential for exploitation by an influence operation when establishing alternative news agencies to spread operation content.

The tag is: *misp-galaxy:disarm-techniques="Identify Media System Vulnerabilities"*

Table 1353. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0081.008.md

Develop New Narratives

Actors may develop new narratives to further strategic or tactical goals, especially when existing narratives adequately align with the campaign goals. New narratives provide more control in terms of crafting the message to achieve specific goals. However, new narratives may require more effort to disseminate than adapting or adopting existing narratives.

The tag is: *misp-galaxy:disarm-techniques="Develop New Narratives"*

Table 1354. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0082.md

Integrate Target Audience Vulnerabilities into Narrative

An influence operation may seek to exploit the preexisting weaknesses, fears, and enemies of the target audience for integration into the operation's narratives and overall strategy. Integrating existing vulnerabilities into the operational approach conserves resources by exploiting already weak areas of the target information environment instead of forcing the operation to create new vulnerabilities in the environment.

The tag is: *misp-galaxy:disarm-techniques="Integrate Target Audience Vulnerabilities into Narrative"*

Table 1355. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0083.md

Reuse Existing Content

When an operation recycles content from its own previous operations or plagiarises from external operations. An operation may launder information to conserve resources that would have otherwise been utilised to develop new content.

The tag is: *misp-galaxy:disarm-techniques="Reuse Existing Content"*

Table 1356. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0084.md

Use Copypasta

Copypasta refers to a piece of text that has been copied and pasted multiple times across various online platforms. A copypasta's final form may differ from its original source text as users add, delete, or otherwise edit the content as they repost the text.

The tag is: *misp-galaxy:disarm-techniques="Use Copypasta"*

Table 1357. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0084.001.md

Plagiarise Content

An influence operation may take content from other sources without proper attribution. This content may be either misinformation content shared by others without malicious intent but now leveraged by the campaign as disinformation or disinformation content from other sources.

The tag is: *misp-galaxy:disarm-techniques="Plagiarise Content"*

Table 1358. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0084.002.md

Deceptively Labelled or Translated

An influence operation may take authentic content from other sources and add deceptive labels or deceptively translate the content into other langauges.

The tag is: *misp-galaxy:disarm-techniques="Deceptively Labelled or Translated"*

Table 1359. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0084.003.md

Appropriate Content

An influence operation may take content from other sources with proper attribution. This content may be either misinformation content shared by others without malicious intent but now leveraged by the campaign as disinformation or disinformation content from other sources. Examples include the appropriation of content from one inauthentic news site to another inauthentic news site or network in ways that align with the originators licencing or terms of service.

The tag is: *misp-galaxy:disarm-techniques="Appropriate Content"*

Table 1360. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0084.004.md

Develop Text-Based Content

Creating and editing false or misleading text-based artefacts, often aligned with one or more specific narratives, for use in a disinformation campaign.

The tag is: *misp-galaxy:disarm-techniques="Develop Text-Based Content"*

Table 1361. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0085.md

Develop AI-Generated Text

AI-generated texts refers to synthetic text composed by computers using text-generating AI technology. Autonomous generation refers to content created by a bot without human input, also known as bot-created content generation. Autonomous generation represents the next step in automation after language generation and may lead to automated journalism. An influence operation may use read fakes or autonomous generation to quickly develop and distribute content to the target audience.

The tag is: *misp-galaxy:disarm-techniques="Develop AI-Generated Text"*

Table 1362. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0085.001.md

Develop Inauthentic News Articles

An influence operation may develop false or misleading news articles aligned to their campaign goals or narratives.

The tag is: *misp-galaxy:disarm-techniques="Develop Inauthentic News Articles"*

Table 1363. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0085.003.md

Develop Document

Produce text in the form of a document.

The tag is: *misp-galaxy:disarm-techniques="Develop Document"*

Table 1364. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0085.004.md

Develop Book

Produce text content in the form of a book.

This technique covers both e-books and physical books, however, the former is more easily deployed by threat actors given the lower cost to develop.

The tag is: *misp-galaxy:disarm-techniques="Develop Book"*

Table 1365. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0085.005.md

Develop Opinion Article

Opinion articles (aka “Op-Eds” or “Editorials”) are articles or regular columns flagged as “opinion” posted to news sources, and can be contributed by people outside the organisation.

Flagging articles as opinions allow news organisations to distinguish them from the typical expectations of objective news reporting while distancing the presented opinion from the organisation or its employees.

The use of this technique is not by itself an indication of malicious or inauthentic content; Op-eds are a common format in media. However, threat actors exploit op-eds to, for example, submit opinion articles to local media to promote their narratives.

Examples from the perspective of a news site involve publishing op-eds from perceived prestigious voices to give legitimacy to an inauthentic publication, or supporting causes by hosting op-eds from actors aligned with the organisation's goals.

The tag is: *misp-galaxy:disarm-techniques="Develop Opinion Article"*

Table 1366. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0085.006.md

Create Fake Research

Create fake academic research. Example: fake social science research is often aimed at hot-button social issues such as gender, race and sexuality. Fake science research can target Climate Science debate or pseudoscience like anti-vaxx.

This Technique previously used the ID T0019.001

The tag is: *misp-galaxy:disarm-techniques="Create Fake Research"*

Table 1367. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0085.007.md

Develop Image-Based Content

Creating and editing false or misleading visual artefacts, often aligned with one or more specific narratives, for use in a disinformation campaign. This may include photographing staged real-life situations, repurposing existing digital images, or using image creation and editing technologies.

The tag is: *misp-galaxy:disarm-techniques="Develop Image-Based Content"*

Table 1368. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0086.md

Develop Memes

Memes are one of the most important single artefact types in all of computational propaganda. Memes in this framework denotes the narrow image-based definition. But that naming is no accident, as these items have most of the important properties of Dawkins' original conception as a self-replicating unit of culture. Memes pull together reference and commentary; image and narrative; emotion and message. Memes are a powerful tool and the heart of modern influence campaigns.

The tag is: *misp-galaxy:disarm-techniques="Develop Memes"*

Table 1369. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0086.001.md

Develop AI-Generated Images (Deepfakes)

Deepfakes refer to AI-generated falsified photos, videos, or soundbites. An influence operation may use deepfakes to depict an inauthentic situation by synthetically recreating an individual's face, body, voice, and physical gestures.

The tag is: *misp-galaxy:disarm-techniques="Develop AI-Generated Images (Deepfakes)"*

Table 1370. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0086.002.md

Deceptively Edit Images (Cheap Fakes)

Cheap fakes utilise less sophisticated measures of altering an image, video, or audio for example, slowing, speeding, or cutting footage to create a false context surrounding an image or event.

The tag is: *misp-galaxy:disarm-techniques="Deceptively Edit Images (Cheap Fakes)"*

Table 1371. Table References

Obtain Private Documents

Procuring documents that are not publicly available, by whatever means — whether legal or illegal, highly-resourced or less so. These documents can include authentic non-public documents, authentic non-public documents have been altered, or inauthentic documents intended to appear as if they are authentic non-public documents. All of these types of documents can be "leaked" during later stages in the operation.

The tag is: *misp-galaxy:disarm-techniques="Obtain Private Documents"*

Table 1379. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0089.md

Obtain Authentic Documents

Procure authentic documents that are not publicly available, by whatever means — whether legal or illegal, highly-resourced or less so. These documents can be "leaked" during later stages in the operation.

The tag is: *misp-galaxy:disarm-techniques="Obtain Authentic Documents"*

Table 1380. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0089.001.md

Alter Authentic Documents

Alter authentic documents (public or non-public) to achieve campaign goals. The altered documents are intended to appear as if they are authentic and can be "leaked" during later stages in the operation.

The tag is: *misp-galaxy:disarm-techniques="Alter Authentic Documents"*

Table 1381. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0089.003.md

Create Inauthentic Accounts

Inauthentic accounts include bot accounts, cyborg accounts, sockpuppet accounts, and anonymous accounts.

The tag is: *misp-galaxy:disarm-techniques="Create Inauthentic Accounts"*

Table 1382. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0090.md

Create Anonymous Accounts

Anonymous accounts or anonymous users refer to users that access network resources without providing a username or password. An influence operation may use anonymous accounts to spread content without direct attribution to the operation.

The tag is: *misp-galaxy:disarm-techniques="Create Anonymous Accounts"*

Table 1383. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0090.001.md

Create Cyborg Accounts

Cyborg accounts refer to partly manned, partly automated social media accounts. Cyborg accounts primarily act as bots, but a human operator periodically takes control of the account to engage with real social media users by responding to comments and posting original content. Influence operations may use cyborg accounts to reduce the amount of direct human input required to maintain a regular account but increase the apparent legitimacy of the cyborg account by occasionally breaking its bot-like behaviour with human interaction.

The tag is: *misp-galaxy:disarm-techniques="Create Cyborg Accounts"*

Table 1384. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0090.002.md

Create Bot Accounts

Bots refer to autonomous internet users that interact with systems or other users while imitating traditional human behaviour. Bots use a variety of tools to stay active without direct human operation, including artificial intelligence and big data analytics. For example, an individual may programme a Twitter bot to retweet a tweet every time it contains a certain keyword or hashtag. An influence operation may use bots to increase its exposure and artificially promote its content across the internet without dedicating additional time or human resources. Amplifier bots promote operation content through reposts, shares, and likes to increase the content's online popularity.

Hacker bots are traditionally covert bots running on computer scripts that rarely engage with users and work primarily as agents of larger cyberattacks, such as a Distributed Denial of Service attacks. Spammer bots are programmed to post content on social media or in comment sections, usually as a supplementary tool. Impersonator bots102 pose as real people by mimicking human behaviour, complicating their detection.

The tag is: *misp-galaxy:disarm-techniques="Create Bot Accounts"*

Table 1385. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0090.003.md

Create Sockpuppet Accounts

Sockpuppet accounts refer to falsified accounts that either promote the influence operation's own material or attack critics of the material online. Individuals who control sockpuppet accounts also man at least one other user account.67 Sockpuppet accounts help legitimise operation narratives by providing an appearance of external support for the material and discrediting opponents of the operation.

The tag is: *misp-galaxy:disarm-techniques="Create Sockpuppet Accounts"*

Recruit Contractors

Operators recruit paid contractor to support the campaign.

The tag is: *misp-galaxy:disarm-techniques="Recruit Contractors"*

Table 1388. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0091.001.md

Recruit Partisans

Operators recruit partisans (ideologically-aligned individuals) to support the campaign.

The tag is: *misp-galaxy:disarm-techniques="Recruit Partisans"*

Table 1389. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0091.002.md

Enlist Troll Accounts

An influence operation may hire trolls, or human operators of fake accounts that aim to provoke others by posting and amplifying content about controversial issues. Trolls can serve to discredit an influence operation's opposition or bring attention to the operation's cause through debate. Classic trolls refer to regular people who troll for personal reasons, such as attention-seeking or boredom. Classic trolls may advance operation narratives by coincidence but are not directly affiliated with any larger operation. Conversely, hybrid trolls act on behalf of another institution, such as a state or financial organisation, and post content with a specific ideological goal. Hybrid trolls may be highly advanced and institutionalised or less organised and work for a single individual.

The tag is: *misp-galaxy:disarm-techniques="Enlist Troll Accounts"*

Table 1390. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0091.003.md

Build Network

Operators build their own network, creating links between accounts — whether authentic or inauthentic — in order amplify and promote narratives and artefacts, and encourage further growth of ther network, as well as the ongoing sharing and engagement with operational content.

The tag is: *misp-galaxy:disarm-techniques="Build Network"*

Table 1391. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0092.md

Create Organisations

Influence operations may establish organisations with legitimate or falsified hierarchies, staff, and content to structure operation assets, provide a sense of legitimacy to the operation, or provide institutional backing to operation activities.

The tag is: *misp-galaxy:disarm-techniques="Create Organisations"*

Table 1392. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0092.001.md

Use Follow Trains

A follow train is a group of people who follow each other on a social media platform, often as a way for an individual or campaign to grow its social media following. Follow trains may be a violation of platform Terms of Service. They are also known as follow-for-follow groups.

The tag is: *misp-galaxy:disarm-techniques="Use Follow Trains"*

Table 1393. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0092.002.md

Create Community or Sub-Group

When there is not an existing community or sub-group that meets a campaign's goals, an influence operation may seek to create a community or sub-group.

The tag is: *misp-galaxy:disarm-techniques="Create Community or Sub-Group"*

Table 1394. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0092.003.md

Acquire/Recruit Network

Operators acquire an existing network by paying, recruiting, or exerting control over the leaders of the existing network.

The tag is: *misp-galaxy:disarm-techniques="Acquire/Recruit Network"*

Table 1395. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0093.md

Fund Proxies

An influence operation may fund proxies, or external entities that work for the operation. An operation may recruit/train users with existing sympathies towards the operation's narratives and/or goals as proxies. Funding proxies serves various purposes including: - Diversifying operation locations to complicate attribution - Reducing the workload for direct operation assets

The tag is: *misp-galaxy:disarm-techniques="Fund Proxies"*

Table 1396. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0093.001.md

Acquire Botnets

A botnet is a group of bots that can function in coordination with each other.

The tag is: *misp-galaxy:disarm-techniques="Acquire Botnets"*

Table 1397. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0093.002.md

Infiltrate Existing Networks

Operators deceptively insert social assets into existing networks as group members in order to influence the members of the network and the wider information environment that the network impacts.

The tag is: *misp-galaxy:disarm-techniques="Infiltrate Existing Networks"*

Table 1398. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0094.md

Identify Susceptible Targets in Networks

When seeking to infiltrate an existing network, an influence operation may identify individuals and groups that might be susceptible to being co-opted or influenced.

The tag is: *misp-galaxy:disarm-techniques="Identify Susceptible Targets in Networks"*

Table 1399. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0094.001.md

Utilise Butterfly Attacks

Butterfly attacks occur when operators pretend to be members of a certain social group, usually a group that struggles for representation. An influence operation may mimic a group to insert controversial statements into the discourse, encourage the spread of operation content, or promote harassment among group members. Unlike astroturfing, butterfly attacks aim to infiltrate and discredit existing grassroots movements, organisations, and media campaigns.

The tag is: *misp-galaxy:disarm-techniques="Utilise Butterfly Attacks"*

Create Personas

Creating fake people, often with accounts across multiple platforms. These personas can be as simple as a name, can contain slightly more background like location, profile pictures, backstory, or can be effectively backstopped with indicators like fake identity documents.

The tag is: *misp-galaxy:disarm-techniques="Create Personas"*

Table 1405. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0097.md

Produce Evidence for Persona

People may produce evidence which supports the persona they are deploying (T0097) (aka “backstopping” the persona).

This Technique covers situations where evidence is developed or produced as part of an influence operation to increase the perceived legitimacy of a persona used during IO, including creating accounts for the same persona on multiple platforms.

The use of personas (T0097), and providing evidence to improve people’s perception of one’s persona (T0097.001), are not necessarily malicious or inauthentic. However, sometimes people use personas to increase the perceived legitimacy of narratives for malicious purposes.

This Technique was previously called Backstop Personas.

The tag is: *misp-galaxy:disarm-techniques="Produce Evidence for Persona"*

Table 1406. Table References

Impersonate Existing Entity

An influence operation may prepare assets impersonating existing entities (both organisations and people) to further conceal its network identity and add a layer of legitimacy to its operation content. Existing entities may include authentic news outlets, public figures, organisations, or state entities.

Users will more likely believe and less likely fact-check news from recognisable sources rather than unknown sites.

An influence operation may use a wide variety of cyber techniques to impersonate a legitimate entity's website or social media account.

This Technique was previously called Prepare Assets Impersonating Legitimate Entities.

The tag is: *misp-galaxy:disarm-techniques="Impersonate Existing Entity"*

Table 1410. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0099.md

Spoof/Parody Account/Site

An influence operation may prepare assets impersonating legitimate entities to further conceal its network identity and add a layer of legitimacy to its operation content. Users will more likely believe and less likely fact-check news from recognisable sources rather than unknown sites. Legitimate entities may include authentic news outlets, public figures, organisations, or state entities.

The tag is: *misp-galaxy:disarm-techniques="Spoof/Parody Account/Site"*

Create Localised Content

Localised content refers to content that appeals to a specific community of individuals, often in defined geographic areas. An operation may create localised content using local language and dialects to resonate with its target audience and blend in with other local news and social media. Localised content may help an operation increase legitimacy, avoid detection, and complicate external attribution.

The tag is: *misp-galaxy:disarm-techniques="Create Localised Content"*

Table 1420. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0101.md

Leverage Echo Chambers/Filter Bubbles

An echo chamber refers to an internet subgroup, often along ideological lines, where individuals only engage with “others with which they are already in agreement.” A filter bubble refers to an algorithm’s placement of an individual in content that they agree with or regularly engage with, possibly entrapping the user into a bubble of their own making. An operation may create these isolated areas of the internet by match existing groups, or aggregating individuals into a single target audience based on shared interests, politics, values, demographics, and other characteristics. Echo chambers and filter bubbles help to reinforce similar biases and content to the same target audience members.

The tag is: *misp-galaxy:disarm-techniques="Leverage Echo Chambers/Filter Bubbles"*

Exploit Data Voids

A data void refers to a word or phrase that results in little, manipulative, or low-quality search engine data. Data voids are hard to detect and relatively harmless until exploited by an entity aiming to quickly proliferate false or misleading information during a phenomenon that causes a high number of individuals to query the term or phrase. In the Plan phase, an influence operation may identify data voids for later exploitation in the operation. A 2019 report by Michael Golebiewski identifies five types of data voids. (1) “Breaking news” data voids occur when a keyword gains popularity during a short period of time, allowing an influence operation to publish false content before legitimate news outlets have an opportunity to publish relevant information. (2) An influence operation may create a “strategic new terms” data void by creating their own terms and publishing information online before promoting their keyword to the target audience. (3) An influence operation may publish content on “outdated terms” that have decreased in popularity, capitalising on most search engines’ preferences for recency. (4) “Fragmented concepts” data voids separate connections between similar ideas, isolating segment queries to distinct search engine results. (5) An influence operation may use “problematic queries” that previously resulted in disturbing or inappropriate content to promote messaging until mainstream media recontextualizes the term.

The tag is: *misp-galaxy:disarm-techniques="Exploit Data Voids"*

Formal Diplomatic Channels

Leveraging formal, traditional, diplomatic channels to communicate with foreign governments (written documents, meetings, summits, diplomatic visits, etc). This type of diplomacy is conducted by diplomats of one nation with diplomats and other officials of another nation or international organisation.

The tag is: *misp-galaxy:disarm-techniques="Formal Diplomatic Channels"*

Table 1444. Table References

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0111.003.md

Email

Delivering content and narratives via email. This can include using list management or high-value individually targeted messaging.

The tag is: *misp-galaxy:disarm-techniques="Email"*

Table 1449. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0112.md

Employ Commercial Analytic Firms

Commercial analytic firms collect data on target audience activities and evaluate the data to detect trends, such as content receiving high click-rates. An influence operation may employ commercial analytic firms to facilitate external collection on its target audience, complicating attribution efforts

and better tailoring the content to audience preferences.

The tag is: *misp-galaxy:disarm-techniques="Employ Commercial Analytic Firms"*

Table 1450. Table References

Post Content

Delivering content by posting via owned media (assets that the operator controls).

The tag is: *misp-galaxy:disarm-techniques="Post Content"*

Table 1453. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0115.md

Share Memes

Memes are one of the most important single artefact types in all of computational propaganda. Memes in this framework denotes the narrow image-based definition. But that naming is no accident, as these items have most of the important properties of Dawkins' original conception as a self-replicating unit of culture. Memes pull together reference and commentary; image and narrative; emotion and message. Memes are a powerful tool and the heart of modern influence campaigns.

The tag is: *misp-galaxy:disarm-techniques="Share Memes"*

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0115.002.md

One-Way Direct Posting

Direct posting refers to a method of posting content via a one-way messaging service, where the recipient cannot directly respond to the poster’s messaging. An influence operation may post directly to promote operation narratives to the target audience without allowing opportunities for fact-checking or disagreement, creating a false sense of support for the narrative.

The tag is: *misp-galaxy:disarm-techniques="One-Way Direct Posting"*

Table 1456. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0115.003.md

Comment or Reply on Content

Delivering content by replying or commenting via owned media (assets that the operator controls).

The tag is: *misp-galaxy:disarm-techniques="Comment or Reply on Content"*

Table 1457. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0116.md

Post Inauthentic Social Media Comment

Use government-paid social media commenters, astroturfers, chat bots (programmed to reply to specific key words/hashtags) influence online conversations, product reviews, web-site comment forums.

The tag is: *misp-galaxy:disarm-techniques="Post Inauthentic Social Media Comment"*

Table 1458. Table References

Links

Attract Traditional Media

Deliver content by attracting the attention of traditional media (earned media).

The tag is: *misp-galaxy:disarm-techniques="Attract Traditional Media"*

Table 1459. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0117.md

Amplify Existing Narrative

An influence operation may amplify existing narratives that align with its narratives to support operation objectives.

The tag is: *misp-galaxy:disarm-techniques="Amplify Existing Narrative"*

Table 1460. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0118.md

Cross-Posting

Cross-posting refers to posting the same message to multiple internet discussions, social media platforms or accounts, or news groups at one time. An influence operation may post content online in multiple communities and platforms to increase the chances of content exposure to the target audience.

The tag is: *misp-galaxy:disarm-techniques="Cross-Posting"*

Table 1461. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0119.md

Post across Groups

An influence operation may post content across groups to spread narratives and content to new communities within the target audiences or to new target audiences.

The tag is: *misp-galaxy:disarm-techniques="Post across Groups"*

Table 1462. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0119.001.md

Post across Platform

An influence operation may post content across platforms to spread narratives and content to new communities within the target audiences or to new target audiences. Posting across platforms can also remove opposition and context, helping the narrative spread with less opposition on the cross-posted platform.

The tag is: *misp-galaxy:disarm-techniques="Post across Platform"*

Table 1463. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0119.002.md

Post across Disciplines

Post Across Disciplines

Table 1467. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0120.002.md

Manipulate Platform Algorithm

Manipulating a platform algorithm refers to conducting activity on a platform in a way that intentionally targets its underlying algorithm. After analysing a platform's algorithm (see: Select Platforms), an influence operation may use a platform in a way that increases its content exposure, avoids content removal, or otherwise benefits the operation's strategy. For example, an influence operation may use bots to amplify its posts so that the platform's algorithm recognises engagement with operation content and further promotes the content on user timelines.

The tag is: *misp-galaxy:disarm-techniques="Manipulate Platform Algorithm"*

Table 1468. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0121.md

Bypass Content Blocking

Bypassing content blocking refers to actions taken to circumvent network security measures that prevent users from accessing certain servers, resources, or other online spheres. An influence operation may bypass content blocking to proliferate its content on restricted areas of the internet. Common strategies for bypassing content blocking include: - Altering IP addresses to avoid IP filtering - Using a Virtual Private Network (VPN) to avoid IP filtering - Using a Content Delivery Network (CDN) to avoid IP filtering - Enabling encryption to bypass packet inspection blocking - Manipulating text to avoid filtering by keywords - Posting content on multiple platforms to avoid platform-specific removals - Using local facilities or modified DNS servers to avoid DNS filtering

The tag is: *misp-galaxy:disarm-techniques="Bypass Content Blocking"*

Table 1469. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0121.001.md

Direct Users to Alternative Platforms

Direct users to alternative platforms refers to encouraging users to move from the platform on which they initially viewed operation content and engage with content on alternate information channels, including separate social media channels and inauthentic websites. An operation may drive users to alternative platforms to diversify its information channels and ensure the target audience knows where to access operation content if the initial platform suspends, flags, or otherwise removes original operation assets and content.

The tag is: *misp-galaxy:disarm-techniques="Direct Users to Alternative Platforms"*

Table 1470. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0122.md

Control Information Environment through Offensive Cyberspace Operations

Controlling the information environment through offensive cyberspace operations uses cyber tools and techniques to alter the trajectory of content in the information space to either prioritise operation messaging or block opposition messaging.

The tag is: *misp-galaxy:disarm-techniques="Control Information Environment through Offensive Cyberspace Operations"*

Table 1471. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0123.md

Delete Opposing Content

Deleting opposing content refers to the removal of content that conflicts with operational narratives from selected platforms. An influence operation may delete opposing content to censor contradictory information from the target audience, allowing operation narratives to take priority in the information space.

The tag is: *misp-galaxy:disarm-techniques="Delete Opposing Content"*

Table 1472. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0123.001.md

Block Content

Content blocking refers to actions taken to restrict internet access or render certain areas of the internet inaccessible. An influence operation may restrict content based on both network and content attributes.

The tag is: *misp-galaxy:disarm-techniques="Block Content"*

Table 1473. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0123.002.md

Destroy Information Generation Capabilities

Destroying information generation capabilities refers to actions taken to limit, degrade, or otherwise incapacitate an actor's ability to generate conflicting information. An influence operation may destroy an actor's information generation capabilities by physically dismantling the information infrastructure, disconnecting resources needed for information generation, or redirecting information generation personnel. An operation may destroy an adversary's information generation capabilities to limit conflicting content exposure to the target audience and crowd the information space with its own narratives.

The tag is: *misp-galaxy:disarm-techniques="Destroy Information Generation Capabilities"*

Table 1474. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0123.003.md

Conduct Server Redirect

A server redirect, also known as a URL redirect, occurs when a server automatically forwards a user from one URL to another using server-side or client-side scripting languages. An influence operation may conduct a server redirect to divert target audience members from one website to another without their knowledge. The redirected website may pose as a legitimate source, host malware, or otherwise aid operation objectives.

The tag is: *misp-galaxy:disarm-techniques="Conduct Server Redirect"*

Table 1475. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0123.004.md

Suppress Opposition

Operators can suppress the opposition by exploiting platform content moderation tools and processes like reporting non-violative content to platforms for takedown and goading opposition actors into taking actions that result in platform action or target audience disapproval.

The tag is: *misp-galaxy:disarm-techniques="Suppress Opposition"*

Table 1476. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0124.md

Report Non-Violative Opposing Content

Reporting opposing content refers to notifying and providing an instance of a violation of a platform's guidelines and policies for conduct on the platform. In addition to simply reporting the content, an operation may leverage copyright regulations to trick social media and web platforms into removing opposing content by manipulating the content to appear in violation of copyright laws. Reporting opposing content facilitates the suppression of contradictory information and allows operation narratives to take priority in the information space.

The tag is: *misp-galaxy:disarm-techniques="Report Non-Violative Opposing Content"*

Table 1477. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0124.001.md

Goad People into Harmful Action (Stop Hitting Yourself)

Goad people into actions that violate terms of service or will lead to having their content or accounts taken down.

The tag is: *misp-galaxy:disarm-techniques="Goad People into Harmful Action (Stop Hitting Yourself)"*

Table 1478. Table References

Facilitate Logistics or Support for Attendance

Facilitate logistics or support for travel, food, housing, etc.

The tag is: *misp-galaxy:disarm-techniques="Facilitate Logistics or Support for Attendance"*

Table 1483. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0126.002.md

Physical Violence

Physical violence refers to the use of force to injure, abuse, damage, or destroy. An influence operation may conduct or encourage physical violence to discourage opponents from promoting conflicting content or draw attention to operation narratives using shock value.

The tag is: *misp-galaxy:disarm-techniques="Physical Violence"*

Table 1484. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0127.md

Conduct Physical Violence

An influence operation may directly Conduct Physical Violence to achieve campaign goals.

The tag is: *misp-galaxy:disarm-techniques="Conduct Physical Violence"*

Table 1485. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0127.001.md

Encourage Physical Violence

An influence operation may Encourage others to engage in Physical Violence to achieve campaign goals.

The tag is: *misp-galaxy:disarm-techniques="Encourage Physical Violence"*

Table 1486. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0127.002.md

Conceal Information Assets

Conceal the identity or provenance of campaign information assets such as accounts, channels, pages etc. to avoid takedown and attribution.

The tag is: *misp-galaxy:disarm-techniques="Conceal Information Assets"*

Table 1487. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0128.md

Use Pseudonyms

An operation may use pseudonyms, or fake names, to mask the identity of operational accounts, channels, pages etc., publish anonymous content, or otherwise use falsified personas to conceal the identity of the operation. An operation may coordinate pseudonyms across multiple platforms, for example, by writing an article under a pseudonym and then posting a link to the article on social media on an account, channel, or page with the same falsified name.

The tag is: *misp-galaxy:disarm-techniques="Use Pseudonyms"*

Table 1488. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0128.001.md

Conceal Network Identity

Concealing network identity aims to hide the existence an influence operation's network completely. Unlike concealing sponsorship, concealing network identity denies the existence of any sort of organisation.

The tag is: *misp-galaxy:disarm-techniques="Conceal Network Identity"*

Table 1489. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0128.002.md

Distance Reputable Individuals from Operation

Distancing reputable individuals from the operation occurs when enlisted individuals, such as celebrities or subject matter experts, actively disengage themselves from operation activities and messaging. Individuals may distance themselves from the operation by deleting old posts or statements, unfollowing operation information assets, or otherwise detaching themselves from the operation's timeline. An influence operation may want reputable individuals to distance themselves from the operation to reduce operation exposure, particularly if the operation aims to remove all evidence.

The tag is: *misp-galaxy:disarm-techniques="Distance Reputable Individuals from Operation"*

Table 1490. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0128.003.md

Launder Information Assets

Laundering occurs when an influence operation acquires control of previously legitimate information assets such as accounts, channels, pages etc. from third parties through sale or exchange and often in contravention of terms of use. Influence operations use laundered assets to reach target audience members from within an existing information community and to complicate attribution.

The tag is: *misp-galaxy:disarm-techniques="Launder Information Assets"*

Table 1491. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0128.004.md

Change Names of Information Assets

Changing names or brand names of information assets such as accounts, channels, pages etc. An operation may change the names or brand names of its assets throughout an operation to avoid detection or alter the names of newly acquired or repurposed assets to fit operational narratives.

The tag is: *misp-galaxy:disarm-techniques="Change Names of Information Assets"*

Table 1492. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0128.005.md

Conceal Operational Activity

Conceal the campaign’s operational activity to avoid takedown and attribution.

The tag is: *misp-galaxy:disarm-techniques="Conceal Operational Activity"*

Table 1493. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0129.md

Generate Content Unrelated to Narrative

An influence operation may mix its own operation content with legitimate news or external unrelated content to disguise operational objectives, narratives, or existence. For example, an operation may generate "lifestyle" or "cuisine" content alongside regular operation content.

The tag is: *misp-galaxy:disarm-techniques="Generate Content Unrelated to Narrative"*

Table 1494. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0129.002.md

Break Association with Content

Breaking association with content occurs when an influence operation actively separates itself from its own content. An influence operation may break association with content by unfollowing, unliking, or unsharing its content, removing attribution from its content, or otherwise taking actions that distance the operation from its messaging. An influence operation may break association with its content to complicate attribution or regain credibility for a new operation.

The tag is: *misp-galaxy:disarm-techniques="Break Association with Content"*

Table 1495. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0129.003.md

Delete URLs

URL deletion occurs when an influence operation completely removes its website registration, rendering the URL inaccessible. An influence operation may delete its URLs to complicate attribution or remove online documentation that the operation ever occurred.

The tag is: *misp-galaxy:disarm-techniques="Delete URLs"*

Table 1496. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0129.004.md

Coordinate on Encrypted/Closed Networks

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0129.005.md

Deny Involvement

Without "smoking gun" proof (and even with proof), incident creator can or will deny involvement. This technique also leverages the attacker advantages outlined in "Demand insurmountable proof", specifically the asymmetric disadvantage for truth-tellers in a "firehose of misinformation" environment.

The tag is: *misp-galaxy:disarm-techniques="Deny Involvement"*

Table 1498. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0129.006.md

Delete Accounts/Account Activity

Deleting accounts and account activity occurs when an influence operation removes its online social media assets, including social media accounts, posts, likes, comments, and other online artefacts. An influence operation may delete its accounts and account activity to complicate attribution or remove online documentation that the operation ever occurred.

The tag is: *misp-galaxy:disarm-techniques="Delete Accounts/Account Activity"*

Table 1499. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0129.007.md

Redirect URLs

An influence operation may redirect its falsified or typosquatted URLs to legitimate websites to increase the operation’s appearance of legitimacy, complicate attribution, and avoid detection.

The tag is: *misp-galaxy:disarm-techniques="Redirect URLs"*

Table 1500. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0129.008.md

Remove Post Origins

Removing post origins refers to the elimination of evidence that indicates the initial source of operation content, often to complicate attribution. An influence operation may remove post origins by deleting watermarks, renaming files, or removing embedded links in its content.

The tag is: *misp-galaxy:disarm-techniques="Remove Post Origins"*

Table 1501. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0129.009.md

Misattribute Activity

Misattributed activity refers to incorrectly attributed operation activity. For example, a state sponsored influence operation may conduct operation activity in a way that mimics another state so that external entities misattribute activity to the incorrect state. An operation may misattribute their activities to complicate attribution, avoid detection, or frame an adversary for negative behaviour.

The tag is: *misp-galaxy:disarm-techniques="Misattribute Activity"*

Table 1502. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0129.010.md

Conceal Infrastructure

Conceal the campaign’s infrastructure to avoid takedown and attribution.

The tag is: *misp-galaxy:disarm-techniques="Conceal Infrastructure"*

Table 1503. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0130.md

Conceal Sponsorship

Concealing sponsorship aims to mislead or obscure the identity of the hidden sponsor behind an operation rather than entity publicly running the operation. Operations that conceal sponsorship may maintain visible falsified groups, news outlets, non-profits, or other organisations, but seek to mislead or obscure the identity sponsoring, funding, or otherwise supporting these entities. Influence operations may use a variety of techniques to mask the location of their social media accounts to complicate attribution and conceal evidence of foreign interference. Operation accounts may set their location to a false place, often the location of the operation's target audience, and post in the region's language

The tag is: *misp-galaxy:disarm-techniques="Conceal Sponsorship"*

Table 1504. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0130.001.md

Utilise Bulletproof Hosting

Hosting refers to services through which storage and computing resources are provided to an individual or organisation for the accommodation and maintenance of one or more websites and related services. Services may include web hosting, file sharing, and email distribution. Bulletproof hosting refers to services provided by an entity, such as a domain hosting or web hosting firm, that allows its customer considerable leniency in use of the service. An influence operation may utilise bulletproof hosting to maintain continuity of service for suspicious, illegal, or disruptive operation activities that stricter hosting services would limit, report, or suspend.

The tag is: *misp-galaxy:disarm-techniques="Utilise Bulletproof Hosting"*

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0132.003.md

Measure Effectiveness

A metric used to measure a current system state. “Are we on track to achieve the intended new system state within the planned timescale?”

The tag is: *misp-galaxy:disarm-techniques="Measure Effectiveness"*

Table 1516. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0133.md

Behaviour Changes

Monitor and evaluate behaviour changes from misinformation incidents.

The tag is: *misp-galaxy:disarm-techniques="Behaviour Changes"*

Table 1517. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0133.001.md

Content

Measure current system state with respect to the effectiveness of campaign content.

The tag is: *misp-galaxy:disarm-techniques="Content"*

Table 1518. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0133.002.md

Awareness

Measure current system state with respect to the effectiveness of influencing awareness.

The tag is: *misp-galaxy:disarm-techniques="Awareness"*

Table 1519. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0133.003.md

Knowledge

Measure current system state with respect to the effectiveness of influencing knowledge.

The tag is: *misp-galaxy:disarm-techniques="Knowledge"*

Table 1520. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0133.004.md

Action/Attitude

Measure current system state with respect to the effectiveness of influencing action/attitude.

The tag is: *misp-galaxy:disarm-techniques="Action/Attitude"*

Table 1521. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0133.005.md

Measure Effectiveness Indicators (or KPIs)

Ensuring that Key Performance Indicators are identified and tracked, so that the performance and effectiveness of campaigns, and elements of campaigns, can be measured, during and after their execution.

The tag is: *misp-galaxy:disarm-techniques="Measure Effectiveness Indicators (or KPIs)"*

Table 1522. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0134.md

Message Reach

Monitor and evaluate message reach in misinformation incidents.

The tag is: *misp-galaxy:disarm-techniques="Message Reach"*

Table 1523. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0134.001.md

Social Media Engagement

Monitor and evaluate social media engagement in misinformation incidents.

The tag is: *misp-galaxy:disarm-techniques="Social Media Engagement"*

Table 1524. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0134.002.md

Undermine

Weaken, debilitate, or subvert a target or their actions. An influence operation may be designed to disparage an opponent; sabotage an opponent's systems or processes; compromise an opponent's relationships or support system; impair an opponent's capability; or thwart an opponent's initiative.

The tag is: *misp-galaxy:disarm-techniques="Undermine"*

Table 1525. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0135.md

Smear

Denigrate, disparage, or discredit an opponent. This is a common tactical objective in political

campaigns with a larger strategic goal. It differs from efforts to harm a target through defamation. If there is no ulterior motive and the sole aim is to cause harm to the target, then choose sub-technique “Defame” of technique “Cause Harm” instead.

The tag is: *misp-galaxy:disarm-techniques="Smear"*

Table 1526. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0135.001.md

Thwart

Prevent the successful outcome of a policy, operation, or initiative. Actors conduct influence operations to stymie or foil proposals, plans, or courses of action which are not in their interest.

The tag is: *misp-galaxy:disarm-techniques="Thwart"*

Table 1527. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0135.002.md

Subvert

Sabotage, destroy, or damage a system, process, or relationship. The classic example is the Soviet strategy of “active measures” involving deniable covert activities such as political influence, the use of front organisations, the orchestration of domestic unrest, and the spread of disinformation.

The tag is: *misp-galaxy:disarm-techniques="Subvert"*

Table 1528. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0135.003.md

Polarise

To cause a target audience to divide into two completely opposing groups. This is a special case of subversion. To divide and conquer is an age-old approach to subverting and overcoming an enemy.

The tag is: *misp-galaxy:disarm-techniques="Polarise"*

Table 1529. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0135.004.md

Cultivate Support

Grow or maintain the base of support for the actor, ally, or action. This includes hard core recruitment, managing alliances, and generating or maintaining sympathy among a wider audience, including reputation management and public relations. Sub-techniques assume support for actor (self) unless otherwise specified.

The tag is: *misp-galaxy:disarm-techniques="Cultivate Support"*

Table 1530. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0136.md

Defend Reputaton

Preserve a positive perception in the public's mind following an accusation or adverse event. When accused of a wrongful act, an actor may engage in denial, counter accusations, whataboutism, or conspiracy theories to distract public attention and attempt to maintain a positive image.

The tag is: *misp-galaxy:disarm-techniques="Defend Reputaton"*

Table 1531. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0136.001.md

Justify Action

To convince others to exonerate you of a perceived wrongdoing. When an actor finds it untenable to deny doing something, they may attempt to exonerate themselves with disinformation which claims the action was reasonable. This is a special case of "Defend Reputation".

The tag is: *misp-galaxy:disarm-techniques="Justify Action"*

Table 1532. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0136.002.md

Energise Supporters

Raise the morale of those who support the organisation or group. Invigorate constituents with zeal for the mission or activity. Terrorist groups, political movements, and cults may indoctrinate their supporters with ideologies that are based on warped versions of religion or cause harm to others.

The tag is: *misp-galaxy:disarm-techniques="Energise Supporters"*

Table 1533. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0136.003.md

Boost Reputation

Elevate the estimation of the actor in the public's mind. Improve their image or standing. Public relations professionals use persuasive overt communications to achieve this goal; manipulators use covert disinformation.

The tag is: *misp-galaxy:disarm-techniques="Boost Reputation"*

Table 1534. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0136.004.md

Cultvate Support for Initiative

Elevate or fortify the public backing for a policy, operation, or idea. Domestic and foreign actors can use artificial means to fabricate or amplify public support for a proposal or action.

The tag is: *misp-galaxy:disarm-techniques="Cultvate Support for Initiative"*

Table 1535. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0136.005.md

Cultivate Support for Ally

Elevate or fortify the public backing for a partner. Governments may interfere in other countries' elections by covertly favouring a party or candidate aligned with their interests. They may also mount an influence operation to bolster the reputation of an ally under attack.

The tag is: *misp-galaxy:disarm-techniques="Cultivate Support for Ally"*

Table 1536. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0136.006.md

Recruit Members

Motivate followers to join or subscribe as members of the team. Organisations may mount recruitment drives that use propaganda to entice sympathisers to sign up.

The tag is: *misp-galaxy:disarm-techniques="Recruit Members"*

Table 1537. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0136.007.md

Increase Prestige

Improve personal standing within a community. Gain fame, approbation, or notoriety. Conspiracy theorists, those with special access, and ideologues can gain prominence in a community by propagating disinformation, leaking confidential documents, or spreading hate.

The tag is: *misp-galaxy:disarm-techniques="Increase Prestige"*

Table 1538. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0136.008.md

Make Money

Profit from disinformation, conspiracy theories, or online harm. In some cases, the sole objective is financial gain, in other cases the objective is both financial and political. Making money may also be a way to sustain a political campaign.

The tag is: *misp-galaxy:disarm-techniques="Make Money"*

Table 1539. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0137.md

Generate Ad Revenue

Earn income from digital advertisements published alongside inauthentic content. Conspiratorial, false, or provocative content drives internet traffic. Content owners earn money from impressions of, or clicks on, or conversions of ads published on their websites, social media profiles, or streaming services, or ads published when their content appears in search engine results. Fraudsters simulate impressions, clicks, and conversions, or they spin up inauthentic sites or social media profiles just to generate ad revenue. Conspiracy theorists and political operators generate ad revenue as a byproduct of their operation or as a means of sustaining their campaign.

The tag is: *misp-galaxy:disarm-techniques="Generate Ad Revenue"*

Table 1540. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0137.001.md

Scam

Defraud a target or trick a target into doing something that benefits the attacker. A typical scam is where a fraudster convinces a target to pay for something without the intention of ever delivering anything in return. Alternatively, the fraudster may promise benefits which never materialise, such as a fake cure. Criminals often exploit a fear or crisis or generate a sense of urgency. They may use deepfakes to impersonate authority figures or individuals in distress.

The tag is: *misp-galaxy:disarm-techniques="Scam"*

Table 1541. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0137.002.md

Raise Funds

Solicit donations for a cause. Popular conspiracy theorists can attract financial contributions from their followers. Fighting back against the establishment is a popular crowdfunding narrative.

The tag is: *misp-galaxy:disarm-techniques="Raise Funds"*

Table 1542. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0137.003.md

Sell Items under False Pretences

Offer products for sale under false pretences. Campaigns may hijack or create causes built on disinformation to sell promotional merchandise. Or charlatans may amplify victims' unfounded fears to sell them items of questionable utility such as supplements or survival gear.

The tag is: *misp-galaxy:disarm-techniques="Sell Items under False Pretences"*

Table 1543. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0137.004.md

Extort

Coerce money or favours from a target by threatening to expose or corrupt information. Ransomware criminals typically demand money. Intelligence agencies demand national secrets. Sexual predators demand favours. The leverage may be critical, sensitive, or embarrassing information.

The tag is: *misp-galaxy:disarm-techniques="Extort"*

Table 1544. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0137.005.md

Manipulate Stocks

Artificially inflate or deflate the price of stocks or other financial instruments and then trade on these to make profit. The most common securities fraud schemes are called "pump and dump" and "poop and scoop".

The tag is: *misp-galaxy:disarm-techniques="Manipulate Stocks"*

Table 1545. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0137.006.md

Motivate to Act

Persuade, impel, or provoke the target to behave in a specific manner favourable to the attacker. Some common behaviours are joining, subscribing, voting, buying, demonstrating, fighting, retreating, resigning, boycotting.

The tag is: *misp-galaxy:disarm-techniques="Motivate to Act"*

Table 1546. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0138.md

Encourage

Inspire, animate, or exhort a target to act. An actor can use propaganda, disinformation, or conspiracy theories to stimulate a target to act in its interest.

The tag is: *misp-galaxy:disarm-techniques="Encourage"*

Table 1547. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0138.001.md

Provoke

Instigate, incite, or arouse a target to act. Social media manipulators exploit moral outrage to propel targets to spread hate, take to the streets to protest, or engage in acts of violence.

The tag is: *misp-galaxy:disarm-techniques="Provoke"*

Table 1548. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0138.002.md

Compel

Force target to take an action or to stop taking an action it has already started. Actors can use the threat of reputational damage alongside military or economic threats to compel a target.

The tag is: *misp-galaxy:disarm-techniques="Compel"*

Table 1549. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0138.003.md

Dissuade from Acting

Discourage, deter, or inhibit the target from actions which would be unfavourable to the attacker. The actor may want the target to refrain from voting, buying, fighting, or supplying.

The tag is: *misp-galaxy:disarm-techniques="Dissuade from Acting"*

Table 1550. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0139.md

Discourage

To make a target disinclined or reluctant to act. Manipulators use disinformation to cause targets to question the utility, legality, or morality of taking an action.

The tag is: *misp-galaxy:disarm-techniques="Discourage"*

Table 1551. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0139.001.md

Silence

Intimidate or incentivise target into remaining silent or prevent target from speaking out. A threat actor may cow a target into silence as a special case of deterrence. Or they may buy the target's silence. Or they may repress or restrict the target's speech.

The tag is: *misp-galaxy:disarm-techniques="Silence"*

Table 1552. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0139.002.md

Deter

Prevent target from taking an action for fear of the consequences. Deterrence occurs in the mind of the target, who fears they will be worse off if they take an action than if they don't. When making threats, aggressors may bluff, feign irrationality, or engage in brinksmanship.

The tag is: *misp-galaxy:disarm-techniques="Deter"*

Table 1553. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0139.003.md

Cause Harm

Persecute, malign, or inflict pain upon a target. The objective of a campaign may be to cause fear or emotional distress in a target. In some cases, harm is instrumental to achieving a primary objective, as in coercion, repression, or intimidation. In other cases, harm may be inflicted for the satisfaction of the perpetrator, as in revenge or sadistic cruelty.

The tag is: *misp-galaxy:disarm-techniques="Cause Harm"*

Table 1554. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0140.md

Defame

Attempt to damage the target's personal reputation by impugning their character. This can range from subtle attempts to misrepresent or insinuate, to obvious attempts to denigrate or disparage, to blatant attempts to malign or vilify. Slander applies to oral expression. Libel applies to written or pictorial material. Defamation is often carried out by online trolls. The sole aim here is to cause harm to the target. If the threat actor uses defamation as a means of undermining the target, then choose sub-technique "Smear" of technique "Undermine" instead.

The tag is: *misp-galaxy:disarm-techniques="Defame"*

Table 1555. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0140.001.md

Intimidate

Coerce, bully, or frighten the target. An influence operation may use intimidation to compel the target to act against their will. Or the goal may be to frighten or even terrify the target into silence or submission. In some cases, the goal is simply to make the victim suffer.

The tag is: *misp-galaxy:disarm-techniques="Intimidate"*

Table 1556. Table References

Links

https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0140.002.md

Spread Hate

Publish and/or propagate demeaning, derisive, or humiliating content targeting an individual or group of individuals with the intent to cause emotional, psychological, or physical distress. Hate speech can cause harm directly or incite others to harm the target. It often aims to stigmatise the target by singling out immutable characteristics such as colour, race, religion, national or ethnic origin, gender, gender identity, sexual orientation, age, disease, or mental or physical disability. Thus, promoting hatred online may involve racism, antisemitism, Islamophobia, xenophobia, sexism, misogyny, homophobia, transphobia, ageism, ableism, or any combination thereof. Motivations for hate speech range from group preservation to ideological superiority to the unbridled infliction of suffering.

The tag is: *misp-galaxy:disarm-techniques="Spread Hate"*

Table 1557. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0140.003.md

Acquire Compromised Asset

Threat Actors may take over existing assets not owned by them through nefarious means, such as using technical exploits, hacking, purchasing compromised accounts from the dark web, or social engineering.

The tag is: *misp-galaxy:disarm-techniques="Acquire Compromised Asset"*

Table 1558. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0141.md

Acquire Compromised Account

Threat Actors can take over existing users' accounts to distribute campaign content.

The actor may maintain the asset's previous identity to capitalise on the perceived legitimacy its previous owner had cultivated.

The actor may completely rebrand the account to exploit its existing reach, or relying on the account's history to avoid more stringent automated content moderation rules applied to new accounts.

See also [Mitre ATT&CK's T1586 Compromise Accounts](https://attack.mitre.org/techniques/T1586/) for more technical information on how threat actors may achieve this objective.

This Technique was previously called Compromise Legitimate Accounts, and used the ID T0011.

The tag is: *misp-galaxy:disarm-techniques="Acquire Compromised Account"*

Table 1559. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0141.001.md

Acquire Compromised Website

Threat Actors may take over existing websites to publish or amplify inauthentic narratives. This includes the defacement of websites, and cases where websites' personas are maintained to add credence to threat actors' narratives.

See also [Mitre ATT&CK's T1584 Compromise Infrastructure](https://attack.mitre.org/techniques/T1584/) for more technical information on how threat actors may achieve this objective.

The tag is: *misp-galaxy:disarm-techniques="Acquire Compromised Website"*

Table 1560. Table References

Links
https://github.com/DISARMFoundation/DISARMframeworks/blob/main/generated_pages/techniques/T0141.002.md

Fabricate Grassroots Movement

This technique, sometimes known as "astroturfing", occurs when an influence operation disguises itself as a grassroots movement or organisation that supports operation narratives.

Astroturfing aims to increase the appearance of popular support for an evolving grassroots movement in contrast to "Utilise Butterfly Attacks", which aims to discredit an existing grassroots movement.

This Technique was previously called Astroturfing, and used the ID T0099.001

The tag is: *misp-galaxy:disarm-techniques="Fabricate Grassroots Movement"*

DealersChoice

DealersChoice is a Flash Player Exploit platform triggered by RTF.

DealersChoice is a platform that generates malicious documents containing embedded Adobe Flash files. Palo Alto Network researchers analyzed two variants — variant A, which is a standalone variant including Flash exploit code packaged with a payload, and variant B, which is a modular variant that loads exploit code on demand. This new component appeared in 2016 and is still in use.

The tag is: *misp-galaxy:exploit-kit="DealersChoice"*

DealersChoice is also known as:

- Sednit RTF EK

FIRST CSIRT Services Framework

The Computer Security Incident Response Team (CSIRT) Services Framework is a high-level document describing in a structured way a collection of cyber security services and associated functions that Computer Security Incident Response Teams and other teams providing incident management related services may provide.

FIRST CSIRT Services Framework is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

FIRST - CIRCL - Jean-Louis Huynen

Service: Monitoring and detection

```
Based on logs, NetFlow data, IDS alerts, sensor networks, external sources, or other
available information security event data, apply a range of methods from simple logic
or pattern matching rules to the application of statistical models or machine learning
in order to identify potential information security incidents. This can involve a vast
amount of data and typically, but not necessarily, requires specialized tools such as
Security Information and Event Management (SIEM) or big data platforms to process. An
important objective of continuous improvement is to minimize the amount of false
alarms that need to be analyzed as part of the Analyzing service.
```

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Monitoring and detection"*

Service: Event analysis

The flow of detected potential information security incidents must be triaged and each one qualified as an information security incident (true positive) or as a false alarm (false positive) using manual and/or automated analysis. This may require manual or automated gathering of additional information, depending on the detection use case. Priority should be given to the analysis of potentially more critical information security incidents to ensure timely reaction to what is most important. Structured qualification of detected potential information security incidents enables effective continuous improvement in a directed way by identifying detection use cases, data sources, or processes with quality issues.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Event analysis"*

Service: Information security incident report acceptance

For a CSIRT, the most important task is the acceptance of reports about information security events and potential information security incidents affecting networks, devices, components, users, organizations, or infrastructure—referred to as the “target”—inside the constituency. The CSIRT should anticipate that potential information security incidents may be reported from various sources in various formats, both manually and automatically. To enable constituents to report information security incidents more effectively, the CSIRT should provide one or more mechanisms as well as guidance or instructions on what and how to securely report information security incidents. Reporting mechanisms can include email, a website, a dedicated information security incident reporting form or portal, or other appropriate methods to enable reports to be submitted safely and securely. Reporting guidance, if not included as part of an information security incidents reporting form itself, should be provided in separate documentation or via a webpage, and should list the specific information that is desirable for inclusion in the report. Due to the potentially large number of automatically escalated potential information security incidents detected via an Information Security Event Management service, this must be planned for in advance of adopting

such interfaces or authorizing constituents to use them.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Information security incident report acceptance"*

Service: Information security incident analysis

This service consists of functions to gain an understanding of the information security incident and its actual and potential impact to identify the underlying issues or vulnerabilities or weaknesses (root causes) that allowed the successful attack, compromise, or exploit. Detailed analysis is often complex and time-consuming. The objective is to identify and characterize the information security incident in as much detail as required or justified by the current understanding of its impact. Information security incidents can be characterized by scope, affected entities, tools, or attacks deployed, timelines, etc. This service may continue in parallel while the Information Security Incident Coordination service and functions are occurring or mitigation/recovery actions are taken. The CSIRT may use other information and its own analysis (see below for some options) or knowledge available from vendors and product security teams or security researchers to better understand what has happened and what steps to take to remedy losses or damage.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Information security incident analysis"*

Service: Artifact and forensic evidence analysis

The services related to the understanding of the capabilities and intent of artefacts (e.g., malware, exploits, volatile memory dumps or disk copies, applications codes, logs, documents), their delivery mechanisms, their propagation, their detection, their mitigation, and their disarming or neutralization. This applies to any formats and sources: hardware, firmware, memory, software, etc. Any artefact or evidence must be preserved and collected without any modification, and kept in isolation. As some artefacts and data may become evidence in the context of law enforcement activities, specific regulations or requirements may apply. Even without preserving a chain-of-custody, this service usually involves complex and time-consuming tasks, and requires expertise, setting up dedicated and monitored analysis environments—with or without external accesses from standard wired or wireless networks (such as performing the forensics activities in a sealed or Faraday room), logging of activities, and compliance with procedures. As part of the handling of information security incidents, digital artefacts may be found on affected systems or malware distribution sites. Artefacts may be the remnants of an intruder attack, such as executables, scripts, files, images, configuration files, tools, tool outputs, logs, live or dormant pieces of code, etc. The analysis is carried out in order to find out some or all of the information listed below, which is not considered to be a complete list: The context required of the artefact to run and to perform its intended tasks, whether malicious or not How the artefacts may have been utilized for the attack: uploaded, downloaded, copied, executed, or created within an organization’s environments or components Which systems have been involved locally and remotely to support the distribution and actions What an intruder did once to access to the system, network, organization, or infrastructure was established: from passively collecting data, to actively scanning and transmitting data for exfiltration purposes, or collecting new action requests, updating itself or making a lateral movement inside a compromised (local) network What a user, user process, or user system did

once the user account or user device was compromised What behavior characterizes the artefacts or compromised systems, either in standalone mode, in conjunction with artefacts or components, connected to a local network or the Internet, or in any combination How the artefacts or compromised systems establish connectivity with the target (e.g., intrusion path, initial target, or detection evasion techniques); What communication architecture (peer-to-peer, command-and-control, both) has been utilized What were the actions of the threat actors, what is their network and systems footprint How the intruders or artefacts evaded detection (even over long periods of time which may include reboot or reinitialization) This can be achieved through various types of activities including media or surface analysis reverse engineering runtime or dynamic analysis comparative analysis Each activity provides additional information about the artefacts. Analysis methods include but are not limited to identification of type and characteristics of artefacts, comparison with known artefacts, observation of artefact execution in a runtime or a live environment, and disassembling and interpreting binary artefacts. In carrying out an analysis of the artefacts, an analyst attempts to reconstruct and determine what the intruder did, in order to detect the exploited vulnerability, assess damages, develop solutions to mitigate against the artefacts, and provide information to constituents and other researchers.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Artifact and forensic evidence analysis"*

Service: Mitigation and recovery

Once the analysis has confirmed a potential information security incident and a response strategy has been developed, this must be turned over into a response plan. Even before a response plan can be finalized, ad-hoc measures may be taken. This service also includes the initiating and tracking of all activities which are performed until the information security incident can be considered closed or new information becomes available that requires further analysis and henceforth may also change the response strategy and plan.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Mitigation and recovery"*

Service: Information security incident coordination

Being notified and kept informed about the details and ongoing activities in relation to an information security incident is critical for all stakeholders and organizations involved. As some activities required for a successful mitigation and recovery might involve management approval, this requires suitable escalation and reporting functions established before any information security incident can be handled effectively and efficiently. As the CSIRT analyzes all information as it becomes available, coordination makes sure that notifications and information reach the right points of contact, track their responses and make sure that all parties carrying out activities report back to provide for accurate situational awareness until the information security incident is considered closed and requiring no further coordination. Stakeholders should have avenues to submit questions, check the status of information security incidents, and report issues to the CSIRT. To engage internal stakeholders, the CSIRT should provide communications channels to advertise the remediation status of information security incidents. To engage external stakeholders, the CSIRT should maintain communications channels to other CSIRTs and CSIRT communities that might provide recommendations or technical support.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Information security incident coordination"*

Service: Crisis management support

While today's information security incidents rarely constitute an organizational or national crisis, they have the potential to do so. But the response to a crisis is usually associated with an emergency that threatens the well-being of humans and society at large, or at least the existence of an organization. As it is established in crisis management, a high-ranking role will take over the responsibility of a crisis, thereby changing the usual line of command for the duration of the emergency. As the systems and networks might contribute to emergencies or are required to be available to respond to a crisis situation, a CSIRT will usually be a critical resource for managing such situations and provide valuable experience but also the established services and networks of points of contacts.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Crisis management support"*

Service: Vulnerability discovery / research

Discovery of a new vulnerability is a necessary first step that starts the overall vulnerability management lifecycle. This service includes those functions and activities that a CSIRT may actively perform through its own research or other services to discover a new vulnerability. Functions and activities related to the passive receipt of new vulnerability information from someone else are described later in the Vulnerability Report Intake service. Occasionally a new vulnerability may be discovered by a CSIRT during other activities, such as while analyzing or investigating an incident report. Another means of learning of a new vulnerability is through reading public sources (e.g., websites, mailing lists), other external sources (e.g., premium services, subscriptions), or by actively looking for vulnerabilities through deliberate research (e.g., through fuzz testing, reverse engineering). Such discoveries should be documented and fed into the organization's vulnerability handling processes, regardless of how the CSIRT discovered or learned of the vulnerability.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Vulnerability discovery / research"*

Service: Vulnerability report intake

One of the primary sources of vulnerability information may be reports or questions sent from a CSIRT's constituents or other third parties. The CSIRT should anticipate that vulnerabilities may be reported from these various sources, and provide a mechanism, a process, and guidance for vulnerability reporting. Reporting infrastructures may include email or a web-based vulnerability reporting form. Not all vulnerabilities are reported directly to a CSIRT by constituents or third parties through the established channels. Supporting guidance should include reporting guidelines, contact information, and any disclosure policies. To enable constituents to report vulnerabilities more effectively, the CSIRT should provide one or more mechanisms as well as guidance or instructions on what and how to securely report vulnerabilities. Reporting mechanisms can include email, a website, a dedicated vulnerability reporting form or portal, or other appropriate methods to enable reports to be submitted safely and securely. Reporting guidance, if not included as part of a vulnerability reporting form itself, should be provided in separate documentation or via a web

page, and should list the specific information that is desirable to be included in the report.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Vulnerability report intake"*

Service: Vulnerability analysis

The Vulnerability Analysis service consists of functions aimed at gaining an understanding of the vulnerability and its potential impact, identifying the underlying issue or flaw (root cause) that allows the vulnerability to be exploited, and identifying one or more remediation or mitigation strategies to prevent or minimize the exploitation of the vulnerability. The Vulnerability Analysis service and functions can continue in parallel while the Vulnerability Coordination service and functions occur with other participants in a coordinated vulnerability disclosure (CVD) process.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Vulnerability analysis"*

Service: Vulnerability coordination

The handling of most vulnerabilities involves notifying, working with, and coordinating the exchange of relevant information with multiple parties including vulnerability finders/reporters, affected vendors, developers, PSRITs, or other trusted experts (e.g., researchers, CSIRTs, vulnerability coordinators) who can work together to analyze and fix the vulnerability.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Vulnerability coordination"*

Service: Vulnerability disclosure

Inform the constituents of any known vulnerabilities (potential entry points for attackers), so that their systems can be kept up to date and monitored for exploits. Disclosure methods may include publication of information through multiple communication channels (e.g., website, email, social media), a vulnerability database, or other media. This service often, but not always, occurs following Vulnerability Coordination.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Vulnerability disclosure"*

Service: Vulnerability response

The functions under this service are intended to determine whether a disclosed vulnerability exists on a constituent's systems, often through the intentional act of looking for the presence of such vulnerabilities. The service can also include the follow-on actions to remediate or mitigate the vulnerability through the deployment of patches or workaround strategies.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Vulnerability response"*

Service: Data acquisition

Solicit, collect, determine, and satisfy the constituencies' information requirements to achieve awareness of important internal and external relevant activities. This service includes the logistics

of collecting relevant information including news of current events, scheduling future events, reports and feeds, filtering the collected information, organizing information for use in incident analysis, prevent, detection, or other activities (such as planning or trending), storing it for later use, improving its “searchability”, and more. Collected data will be used to determine the preventative measures needed and to help make informed decisions regarding incident management and information assurance activities. Without a basic perception of important environmental elements, the risk of other services forming an incorrect picture increases. CSIRTs will need to establish policy and procedures, and may employ technology to collect and vet information.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Data acquisition"*

Service: Analysis and synthesis

The process of using current data, history, and analysis techniques to determine what is occurring that may impact the constituency assets and security posture, often done by determining an answer to a question or testing an intuition. Analysis may reveal when events do not match typical expected behavior, or may reveal information about the circumstance, nature, or origin of events or behaviors. Analysis may reveal implications to current and future situations. For example: a system may log that a user ID successfully logged into the system, but the system does not indicate whether the event was performed by a legitimate user. New sources (such as interviews with the user) will need to be incorporated into the analysis to provide the team with a more accurate picture to determine the legitimacy of the event. A variety of techniques may be used to analyze and interpret the collected data and its effect upon the constituency.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Analysis and synthesis"*

Service: Communication

The knowledge obtained from situational awareness must be communicated to the constituency. This will allow it to react to observations and to take actions that will improve defensive situations, e.g., reducing third-party risk by improving the security environment at certain high-risk suppliers.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Communication"*

Service: Awareness building

This service includes working with the constituency, experts, and trusted partners to raise the collective understanding of threats and actions that can be taken to prevent or mitigate the risks posed by these threats.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Awareness building"*

Service: Training and education

A training and education program can help the CSIRT to establish relationships and to improve the overall cybersecurity posture of its constituency, including the ability to prevent future incidents

from happening. Such a program can help maintain user awareness help the constituency understand the changing landscape and threats facilitate information exchange between the CSIRT and its constituency train the constituency on tools, processes and procedures related to security and incident management. This can be done through various types of activities including documenting the knowledge, skills, and abilities (KSAs) required, developing educational and training materials, delivering content, mentoring, and professional and skill development. Each of these activities will collectively contribute to the constituency's and the team's capabilities.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Training and education"*

Service: Exercises

Services are offered by the organization to constituents that support the design, execution, and evaluation of cyber exercises intended to train and/or evaluate the capabilities of individual constituents and the stakeholder community as a whole, including communications capabilities. These types of exercises can be used to test policies and procedures: assess whether there are sufficient policies and procedures in place to effectively detect, respond and mitigate incidents. This is, generally, a paper/table-top exercise. test operational readiness: assess whether the organization has an incident management capability that is able to detect, respond to and mitigate incidents in a timely and successful manner, as well as to test whether the right people are in place, directories are up-to-date, and if procedures are executed correctly. This service addresses both the needs of the organization and the needs of its constituents. More specifically, through the simulation of cybersecurity events/incidents, exercises can be used for one or several objectives: Demonstrate: Illustrate cybersecurity services and functions, as well as vulnerabilities, threats, and risks, in order to raise awareness. Train: Instruct staff on new tools, techniques, and procedures:

Exercise: Provide an opportunity for staff to use tools, techniques, and procedures they are expected to be knowledgeable about. Exercising is necessary for perishable skills and helps improve and maintain efficiency. Assess: Analyze and understand the level of effectiveness and efficiency of cybersecurity services and functions, as well as the level of staff preparedness. Verify: Determine whether a specified level of effectiveness and/or efficiency can be achieved for cybersecurity services and functions.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Exercises"*

Service: Technical and policy advisory

Support the CSIRT constituency and key stakeholders, internal or external to the constituency, in activities related to risk management and business continuity, providing technical advice as needed and contributing to the creation and implementation of the constituency's policies, as well as influencing them to enable the CSIRT to be more effective. Policies are also important in legitimizing the services of a CSIRT.

The tag is: *misp-galaxy:first-csirt-services-framework="Service: Technical and policy advisory"*

Function: Log and sensor management

Sensors and log sources need operational management throughout their lifecycle. They must be deployed, onboarded, and decommissioned. Outages, data quality/scope, and configuration issues must be identified and resolved. Sensors that have some form of configuration such as pattern definitions need their configuration maintained in order to remain effective. Sensors may also include external detection services or Open Source Intelligence (OSINT) sources, if they form the basis for detection use cases.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Log and sensor management"*

Function: Detection use case management

New detection approaches are developed, tested, and improved, and eventually onboarded into a detection use case in production. Instructions for analyst triage, qualification, and correlation need to be developed, for example in the form of playbooks and Standard Operating Procedures (SOPs). Use cases that do not perform well, i.e., that have an unfavorable benefit/effort ratio, need to be improved, redefined, or abandoned. The portfolio of detection use cases should be expanded in a risk-oriented way and in coordination with preventive controls.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Detection use case management"*

Function: Contextual data management

The various contextual data sources that are involved in detection and enrichment need to be managed throughout their lifecycle. These can be live APIs to or exports from other IT systems such as a Configuration Management Database (CMDB), Identity and Access Management (IAM), or Threat Intel systems, or entirely separate data sets that need to be managed manually. The latter would be the case for indicator lists, watchlists and whitelists to suppress false positives.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Contextual data management"*

Function: Correlation

Potential information security incidents pertaining to the same assets (e.g., systems, services, customers) or identities (e.g., users), or which are otherwise directly related to other potential information security incidents are grouped together and escalated as a single information security incident in order to avoid duplicate efforts. New potential information security incidents directly related to ongoing information security incidents are assigned to that information security incident instead of opening a new, separate information security incident.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Correlation"*

Function: Qualification

Potential information security incidents need to be triaged and each qualified as an information security incident (true positive) or as a false alarm (false positive). Because analysts have a limited

number of potential information security incidents they can analyze, and in order to avoid alert fatigue, automation is key. Mature tooling facilitates effective triage by enriching with context information, assigning risk scores based on the criticality of affected assets and identities and/or automatically identifying related information security events. Recurring cases that can be automated should be identified and automated. Potential information security incidents with higher criticality should be analyzed before less critical ones. In addition to qualification as true or false positives, a more fine-grained qualification is an important input for continuous improvement of detection use cases as well as the management of log sources, sensors, and contextual data sources. More fine-grained qualification can also support the definition of higher-quality KPIs for measuring the success of this service area.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Qualification"*

Function: Information security incident report receipt

Effective intake of information security incident reports requires mechanisms and processes to receive the reports from constituents, stakeholders, and third parties (e.g., finders, researchers, ISACs, other CSIRTs). Information security incident reports may include affected devices/networks/users/organizations, conditions already identified like exploited vulnerabilities, impact both on technical and business level, and actions that have been taken to start remediation and/or mitigation steps and potentially resolution. Occasionally, information security incident information may be received jointly as part of the input to other services, most namely the Vulnerability Report Intake (e.g., if an information security incident is reported that has been identified while analyzing a vulnerability report). Automatically submitted reports might or might not be acknowledged pending further choices of the implemented interfaces and protocols.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Information security incident report receipt"*

Function: Information security incident triage and processing

Information Security Incident Reports are reviewed and triaged to obtain an initial understanding of the information security incident in question. It is of particular importance whether it has a real information security impact on the target and can result (or has already resulted) in damage to the confidentiality, availability, integrity, and/or authenticity of information assets or other assets. Depending on the amount of detail and quality of the information provided in the initial report, it may or not be obvious whether a real information security incident has occurred or if there is a different reason—such as misconfiguration or hardware failure. The next step will be determined on the basis of the preliminary assessment (e.g., process the report for further analysis; seek additional information from the reporter or other sources; decide that the report needs no further action or is a false alarm). It is possible that attacks may originate from within the constituency of a CSIRT, may target this constituency, or the constituency is affected by collateral effects only. If the CSIRT does not provide Information Security Management services for the identified targets, then the report should be forwarded securely to an external group for handling, such as the affected organization(s) or CSIRT(s). Unless there is a reason to decline an information security incident report or the report has been forwarded to another entity responsible for its handling, the report

should be passed on to the Vulnerability Analysis service for further review, analysis, and handling.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Information security incident triage and processing"*

Function: Information security incident triage (prioritization and categorization)

The Analyzing Information Security Incidents service begins with a review of the available information to categorize, prioritize, and assess the impact an information security incident has on the involved systems relevant to the CSIRT's mandate. Some of this may have been documented during the Information Security Incident Report Triage and Processing function (of the Information Security Incident Report Intake service) if the information security incident was reported to the CSIRT by a constituent or third party. If prior triage has not already been completed, the information security incident may be assigned to a subject matter expert who can provide technical confirmation that it has some impact on the involved systems and is relevant to the CSIRT's mandate (i.e., a potential security impact on networks or systems that can result in damage to the confidentiality, availability, or integrity of information assets in an area the CSIRT according to its mandate).

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Information security incident triage (prioritization and categorization)"*

Function: Information collection

Enable the collection of all valuable information to obtain the best understanding of the context, so that the origin and the content of the information can be appropriately evaluated and tagged to be used for any further processing. While collecting information, the agreed sharing policies and limitations of what data can be used in which context or for what form of processing must be accepted and adhered to. Also, the collection mechanisms and procedures must ensure that proper labeling and attribution of sources is used in order to later validate the origins as well as the appropriateness or authenticity.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Information collection"*

Function: Detailed analysis coordination

As more detailed technical analysis may be required, such analysis may be executed by other experts (inside or outside the host organization or CSIRT) or other third parties (such as a service provider specialized in such analysis). This requires initiating and tracking such activities up to the successful delivery of the desired analysis.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Detailed analysis coordination"*

Function: Information security incident root cause analysis

This function involves the process and actions required to understand the architecture, usage, or implementation flaw(s) that caused or exposed systems, networks, users, organizations, etc. to the kind of attack or exploit or compromise as exercised against the targets of an information security incident. It is also concerned with the circumstances in which an attacker could compromise more systems based on the initial access to gain further access. Depending on the nature of the information security incident, it may be difficult for a CSIRT to perform this function thoroughly. In many situations, this function may best be conducted by the affected target itself, as especially in the context of Coordinating CSIRTs no detailed technical knowledge is available about systems or networks that have been compromised.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Information security incident root cause analysis"*

Function: Cross-incident correlation

This function involves the correlation of available information about multiple information security incidents to determine interrelations, trends, or applicable mitigations from already closed information security incidents to improve the response to currently handled information security incidents.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Cross-incident correlation"*

Function: Media or surface analysis

This function involves identification and characterization of basic information and metadata about artefacts, including but not limited to file types, string outputs, cryptographic hashes, certificates, file sizes, file/directory names. As all available information is gathered and analyzed further, this may be used to review any public/open or private/closed source information repositories to learn more about the artefact or its behavior, as such information can be used to determine the next steps.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Media or surface analysis"*

Function: Reverse engineering

To provide a deeper analysis of malware artefacts to include identifying hidden actions and triggering commands. Reverse engineering allows the analyst to dig past any obfuscation and compilation (for binaries) and identify the program, script, or code that makes up the malware, either by uncovering any source code or by disassembling the binary into assembly language and interpreting it. The analyst uncovers all of the machine language exposed functions and actions the malware can perform. Reverse engineering is a deeper analysis that is carried out when surface and runtime analysis do not provide the full information needed.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Reverse engineering"*

Function: Run time or dynamic analysis

This function involves understanding of an artifact's capabilities via observation while running the sample in a real or emulated environment (e.g., sandbox, virtual environment, and hardware or software emulators). Use of a simulated environment captures changes to the host, network traffic, and output from execution. The basic premise is to try to see artefact in operation in as close to a real-life situation as possible.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Run time or dynamic analysis"*

Function: Comparative analysis

This function involves exploring an artefact's relationship to other artefacts. This may identify similarities in code or modus operandi, targets, intent, and authors. Such similarities can be used to derive the scope of an attack (e.g., is there a larger target, has similar code been used before). Comparative analysis techniques can include exact match comparisons or code similarity comparisons. Comparative analysis provides a broader view of how the artefact or similar versions of it were used and changed over time, helping to understand the evaluation of malware or other malicious types of artefacts.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Comparative analysis"*

Function: Response plan establishment

Without fully understanding the business impact and requirements to mitigate and recover, no meaningful response will be provided. As there is a conflict of interest—tracking the attack to gain more intelligence vs. containing the attack to avoid further losses—it is necessary to take all interests into consideration and work out a response plan that is plausible to address the known facts and provide the desired outcome within the required timeframe. As with all plans, it must be considered that whenever new analysis results become available, the new findings need to be reviewed. Indeed, the response plan will usually need to be changed to provide continuous orientation and guidance. But without such plan—unless the response is handled by one small organizational group with little requirement of external interfaces or other entities—the activities might not be carried out effectively or efficiently due to a lack of coordination.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Response plan establishment"*

Function: Ad hoc measures and containment

The immediate challenge in case of an information security incident is to stop it from spreading. While systems are compromised or malware is active on end user systems, further data losses and more compromises occur. It is usually the main objective of attacks to reach out to specific data and systems, including attacks (including but not limited to lateral movements) to other organizations both inside and outside the organization suffering from the information security incident. Stopping or at least limiting the extent of any malicious activities or further losses requires short-term actions such as blocking or filtering traffic and removing access to specific services or systems, and can also result in the disconnection of critical systems. Denying further access to potentially critical

evidence data will allow a full analysis of such evidence. Denying further access to other systems and networks will also limit the exposure from liability as a result of damage done to other organizations. Stopping immediate damage and limiting the extent of malicious activity through short-term tactical actions (for example, blocking or filtering traffic) can also involve regaining control of systems. As long as attackers or active malware have ready access to more systems or networks, no return to normal operation will be possible.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Ad hoc measures and containment"*

Function: System restoration

Restore the integrity of affected systems and returning the affected data, systems, and networks to a non-degraded operational state, restoring the impacted services to full functionality. As business reality usually demands systems return to normal operation as soon as possible, there is a risk that not all means of unauthorized access have been removed successfully. Therefore, unless the analysis results are already available, even returned systems must be carefully monitored and managed. Especially if identified vulnerabilities and weaknesses cannot (yet) be eliminated, improved protection and detection mechanisms need to be applied to avoid the same or similar or types of information security incidents.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: System restoration"*

Function: Other information security entities support

A CSIRT may provide direct (onsite) assistance to help the constituents to recover from losses and to remove vulnerabilities. This might be a direct extension of offering analysis services on-site (see above). On the other hand, a CSIRT might choose to support the staff of the constituents responding to the information security incident with more detailed explanations, recommendations, etc.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Other information security entities support"*

Function: Communication

A CSIRT must account for the most accurate audience as communications are crafted and released. In return, a CSIRT must also be equipped to receive incoming feedback, reports, comments, and questions from a variety of sources based on its own communication. The security policy and the information sharing policy may require information to be handled in a strict manner. The CSIRT must be able to share with stakeholders in a reliable, secure, and private manner, both externally and internally. Non-disclosure agreements must be set up as far in advance as possible and communication resources set up accordingly. As an extension, the concept of “information under embargo” can also be used. Hence, a retention policy must also be established to ensure that both the data used to craft the information and the information itself are properly handled, shared, and kept based on constraints—such as time—until these constraints become void or the information is publicly disclosed. Communication channels can take multiple forms based upon the needs of stakeholders and constituents. All information communicated must be tagged according to the information sharing policy. Traffic Light Protocol may be utilized.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Communication"*

Function: Notification distribution

A security incident touches on many internal and potentially external entities and, possibly, systems, and networks. As CSIRTs are a central point for receiving reports of potential information security incidents, they also serve as a hub for notifying authorized points of contact about them. The notification usually will provide not only the appropriate technical details but also information about the expected response and a point of contact for any fellow-up.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Notification distribution"*

Function: Relevant information distribution

As the response to an information security incident progresses, more analysis results and reports from potentially other security experts, CSIRTs, or victims become available. It may be helpful to pass some of the information and lessons learned on to the Knowledge Transfer Service Area (if supported) to improve training and technical documents as well as to help create appropriate awareness, especially if new attacks or incident trends are identified.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Relevant information distribution"*

Function: Activities coordination

As many entities are potentially involved in responding to an information security incident, it is necessary to track the status of all communication and activities. This involves the actions requested by a CSIRT or requests for sharing of further information as well as requests for technical analysis of artefacts s or the sharing of indicators of compromise, information about other victims, etc. This primarily occurs when the CSIRT is reliant on expertise and resources outside of the direct control of the CSIRT to effectuate the actions necessary to mitigate an incident. But it also occurs inside larger organizations for which an internal CSIRT coordinates the mitigation and recovery activities. By offering bilateral or multilateral coordination, the CSIRT participates in the exchange of information to enable those resources with the ability to take action to do so or to assist others in the detection, protection, or remediation of ongoing activities from attackers and help to close the information security incident.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Activities coordination"*

Function: Reporting

Delivering concise and factual information about the current status of activities requested or carried out in response to an information security incident. Instead of waiting to be pulled for such information as part of an ongoing coordinated action as required for any successful response, timely reports are critical to enable effective coordination.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Reporting"*

Function: Media communication

Communicating with the media is unavailable in many cases. While CSIRTs usually try to avoid such contact, it is important to realize that the media can help to mitigate specific types of ongoing and large-scale attacks causing information security incidents. For this it is necessary to explain what is causing the information security incidents and explain the impact on users and/or organizations. In some cases, a CSIRT might choose to provide this information already in a manner suitable for release to the public, but this certainly requires specific skills inside the CSIRT not readily available in most. In any case, if a CSIRT communicates with the media, it must take great care to simplify the technical issues as much as possible and leave out all confidential information.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Media communication"*

Function: Information distribution to constituents

As the response to a crisis progresses, information must be distributed and disseminated. As the CSIRT has established such resources for its own purposes, crisis management may see it as appropriate or necessary to use such resources.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Information distribution to constituents"*

Function: Information security status reporting

The function involves delivering concise and factual information about the current status of cyber security inside the constituency. As a crisis might be used to start other attacks or as occurring attacks might be part of the overall activities leading this crisis, it is very important for the crisis management team to establish complete situational awareness. The CSIRT can provide such situational awareness for its services and constituents. This may either be requested or is expected by standard policies in a time of crisis. In any case, as crisis management is only successful based on the established information flow as it depends on coordinate resources to address the most critical aspects of the crisis, reporting must be timely and accurate. As ongoing information security incidents will require resources to handle them, a decision must be taken to either discontinue the response for the duration of the incident (and allocate the now available resources to other areas) or to carry on. Reasonable decisions can only be taken based on the best situational awareness available.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Information security status reporting"*

Function: Strategic decisions communication

Informing other entities in a timely manner about the impact caused by the crisis on currently open information security incidents provides a clear understanding of what support can also be provided by the CSIRT during the duration of the crisis, and makes sure that entities understand what to expect. It also makes sure that other parties stop their support or interaction with the CSIRT as they might believe that the crisis is taking over. As the crisis management team may decide to

postpone the response to an actual information security incident due to a crisis, such decisions need to be communicated to all entities currently informed and participating. This is to avoid misunderstandings and further issues that may also lead to a loss of trust in the CSIRT and/or host organization.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Strategic decisions communication"*

Function: Incident response vulnerability discovery

During the course of analyzing a security incident, information may be discovered that indicates that a vulnerability was exploited by the attacker. An incident may have been enabled through exploitation of a known vulnerability that was previously unpatched or unmitigated; or it may be due to a new (zero-day) vulnerability. Some of this vulnerability information might be received as an output from one of the services of the Information Security Incident Management service area if a vulnerability was exploited as part of an incident. The information can then be passed on to the Vulnerability Triage function or the Vulnerability Analysis service, as appropriate.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Incident response vulnerability discovery"*

Function: Public source vulnerability discovery

A CSIRT may initially learn about a new vulnerability from various public sources that announce such information. The sources can include vendor announcements, security websites, mailing lists, vulnerability databases, security conferences, social media, etc. This function may also learn of new vulnerabilities through other third-party sources that may not be completely open to the public, such as through paid subscriptions or premium services where information is shared with only a limited group. Staff may be assigned the responsibility to perform this function and collect information to organize it for further review and sharing. Similar vulnerability information might also be received from the services of the Situational Awareness service area.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Public source vulnerability discovery"*

Function: Vulnerability research

This function includes the discovery of new vulnerabilities as a result of specific CSIRT activities, such as the testing of systems or software using fuzz testing (fuzzing), or through the reverse engineering of malware. This function may also receive input from the service(s) of the Information Security Incident Management service area or the Situational Awareness service area that would initiate this function to look for suspected vulnerabilities. The discovery of a new vulnerability as a result of this vulnerability research function may become input to the Incident Response service, Vulnerability Detection function (see sub-functions for Vulnerability Scanning and Vulnerability Penetration Testing).

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability research"*

Function: Vulnerability report receipt

Effective intake of vulnerability reports requires mechanisms and processes to receive the reports from constituents, stakeholders, and third parties (finders, researchers, vendors, PSIRTs, other CSIRTs or vulnerability coordinators, etc.). Vulnerability information may include affected devices, conditions necessary to exploit the vulnerability, impact (e.g., privilege escalation, data access, etc.), as well as actions taken to resolve the vulnerability, remediation and/or mitigation steps, and resolution. Occasionally, vulnerability information may be received jointly as part of the input to other services, most notably the Information Security Incident Report Intake (e.g., if a vulnerability is reported to be exploited as part of an incident report).

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability report receipt"*

Function: Vulnerability report triage and processing

Vulnerability Reports are reviewed and triaged to obtain an initial understanding of the vulnerability in question and determine what to do next (e.g., process the vulnerability for further analysis, seek additional information from the reporter or other sources, decide that the vulnerability needs no further action). Depending on the amount of detail and quality of the information provided in the vulnerability report, it may or not be obvious whether a new vulnerability exists. Unless there is a reason to decline a vulnerability report, the report should be passed on to the Vulnerability Analysis service for further review, analysis, and handling. If the CSIRT does not provide a Vulnerability Analysis service, then the report should be securely forwarded to an external group for handling, such as the affected vendor(s), PSIRT(s), or a vulnerability coordinator.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability report triage and processing"*

Function: Vulnerability triage (validation and categorization)

The Vulnerability Analysis service begins with a review of the available information to categorize, prioritize, and assess whether a vulnerability has some impact on the involved systems and is relevant to the CSIRT's mandate. Some of this may have been documented during the Vulnerability Report Triage and Processing function (of the Vulnerability Report Intake service) if the vulnerability was reported to the CSIRT by a constituent or third party. If prior triage has not already been completed, the vulnerability may be assigned to a subject matter expert who can provide technical confirmation that it has some impact on the involved systems and is relevant to the CSIRT's mandate (i.e., the potential security impact on networks or systems that can result in damage to the confidentiality, availability, or integrity of information assets in an area of the CSIRT according to its mandate).

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability triage (validation and categorization)"*

Function: Vulnerability root cause analysis

The goal of this analysis is to identify the root cause of the vulnerability, identifying the circumstances that allow a vulnerability to exist, and in which circumstances an attacker can consequently exploit the vulnerability. This analysis may also attempt to understand the weakness(es) leveraged to instigate an incident and the adversarial tradecraft utilized to leverage that weakness. Depending on the nature of the vulnerability, it may be difficult for a CSIRT to perform this function thoroughly. In some cases, this function may have already been performed by the finder or reporter of the vulnerability. In many situations, this function may best be conducted by the product vendor or developer of the affected software or system or their respective PSIRT. It is also possible that a vulnerability is present in more than one product, in which case multiple analyses may be needed of the affected software or systems, requiring coordination with multiple vendors, PSIRTs, or stakeholders.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability root cause analysis"*

Function: Vulnerability remediation development

This function will ideally identify a remediation or a fix for a vulnerability. If a vendor patch or fix is not available in a timely manner, a temporary solution or workaround, called a mitigation, may be recommended, such as disabling the affected software or making configuration changes, to minimize the potential negative effects of the vulnerability. Note that the actual application or deployment of a remediation (patch) or mitigation (workaround) is a function of a separate service, called Vulnerability Response in this framework. As part of the Vulnerability Analysis service and Remediation Development, this function may optionally include other sub-functions or activities, such as validating the changing of a procedure or design, reviewing remediation by a third party, or identifying any new vulnerabilities introduced in the remediation steps. Vulnerabilities that are not remediated or mitigated should be documented as acceptable risks. This function will often receive information or input from the affected product's vendor(s), sometimes as part of the initial report or announcement handled by other services or functions.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability remediation development"*

Function: Vulnerability notification/reporting

The handling of most vulnerabilities involves notifying, working with, and coordinating the exchange of relevant information with multiple parties including the affected vendors, developers, PSIRTs, or other trusted experts (e.g., researchers, CSIRTs, vulnerability coordinators) who can work together to analyze and fix the vulnerability.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability notification/reporting"*

Function: Vulnerability stakeholder coordination

Coordinate the exchange of information among the finders/researchers, vendors, PSIRTS, and any other participants in the coordinate vulnerability disclosure (CVD) efforts to analyze and fix the

vulnerability and prepare for the disclosure of the vulnerability. This coordination should also include agreement by participants on the timing and synchronization of the disclosure.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability stakeholder coordination"*

Function: Vulnerability disclosure policy and infrastructure maintenance

CSIRTs that handle vulnerability reports should define their vulnerability disclosure policy and make that policy available to its constituents, stakeholders, and CVD participants, preferably by publishing it on the CSIRT's website. The vulnerability disclosure policy will provide transparency to stakeholders and help to promote appropriate disclosure policies. Policies can range from no disclosure, where no vulnerability information is disclosed, to limited disclosure, where only some information is made available, to full disclosure, where all information is disclosed, which may include proof-of-concept exploits. The disclosure policy should include factors such as the scope of the policy, references to any reporting mechanisms and guidelines, and expected timeframes and mechanisms for the disclosure of the vulnerability.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability disclosure policy and infrastructure maintenance"*

Function: Vulnerability announcement/communication/dissemination

Disclose vulnerability information to defined constituents. The disclosure can be made through any or all of the mechanisms identified in the vulnerability disclosure policy. Dissemination mechanisms can vary depending on the needs or expectations of the target audience. The communication can be in the form of an announcement or security advisory distributed via email or text messaging, a publication posted to a website or social media channel, or other communication forms and channels as appropriate. Content to be included in the disclosure should follow a defined format, which typically can include information such as an overview or description, a unique vulnerability identifier, impact, severity, or CVSS score, resolution (remediation or mitigation), and supporting references or materials.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability announcement/communication/dissemination"*

Function: Post-vulnerability disclosure feedback

Following the disclosure of a new vulnerability, CSIRTs can expect to receive follow-on communications in the form of questions from some constituents about a vulnerability document. The questions may indicate a need for clarification, revision, or amendment of the vulnerability disclosure mechanism, if warranted. Information from constituents may simply be an acknowledgement or receipt of the vulnerability document, or the constituent may report an issue or difficulty in deploying the suggested remediation/mitigation. If the vulnerability was determined

to have been already exploited, constituents may be reporting newly discovered incidents as a result of the vulnerability disclosure. Such reports should feed into the functions of the CSIRT's Incident Reporting service.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Post-vulnerability disclosure feedback"*

Function: Vulnerability detection / scanning

The goal of this function is to detect any previously unpatched or unmitigated vulnerabilities before they are exploited or impact the network or devices. This function may be initiated in response to an announcement about a new vulnerability, or it may be achieved as part of a periodically scheduled scan for known vulnerabilities. In order to provide vulnerability detection effectively, it is useful to have a systems inventory. Having such an inventory that can be queried for software version information can enable an organization to quickly assess the likely prevalence of a newly reported vulnerability in its infrastructure.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability detection / scanning"*

Function: Vulnerability remediation

Vulnerability remediation is intended to resolve or eliminate a vulnerability. For software vulnerabilities, this typically occurs through the deployment and installation of vendor-provided solutions in the form of software updates or patches. When approved patches are unavailable or cannot be deployed, an alternative mitigation or workaround may be applied as a countermeasure to prevent exploitation of the vulnerability. This function often follows a positive identification of a vulnerability as the result of the Vulnerability Detection/Scanning/Hunting function.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Vulnerability remediation"*

Function: Policy aggregation, distillation, and guidance

The collection, aggregation, and distillation of policy establishes the basis of acceptable normal activity. The end result is a context that establishes how the constituency and its infrastructure is supposed to be operating under acceptable conditions. For organizational CSIRTs, context includes understanding the organizations acceptable policies, plans, normal operating conditions, accepted risks, and tradeoffs. Understanding and context establish the basis against which observations can be evaluated.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Policy aggregation, distillation, and guidance"*

Function: Asset mapping to functions, roles, actions, and key risks

CSIRT teams need to understand the current cyber security state of a constituency, and have a good understanding of what is acceptable security. They may need to know: Legitimate users of internal and public-facing systems and devices Authorized devices and what they are used for Approved processes and applications, where they are allowed, and how they serve the constituency This information helps establish prioritization of assets that are potentially at risk, which can provide context for incident management activities. The more precise the information available to CSIRT team, the easier it will be to infer security issues and do something about them. Precise information may mean the CSIRT having access to established security policies, current access controls, up-to-date hardware and software inventories, and detailed network diagrams.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Asset mapping to functions, roles, actions, and key risks"*

Function: Collection

Information and data collection activities extend beyond feeds providing automated information. Collection includes identifying useful sources such as information-relevant external activities including news from other constituencies, media sources, and other CSIRTs or security organizations, internal activities (e.g., organizational changes), technology developments, external events, political events, attack trends, defensive trends, conferences, available training, and more. The data collection function supports other services such as Security Event Management, Incident Management, and Knowledge Transfer. It also supports functions and activities within these services such as analysis, prediction, response, and risk mitigation. Newly collected information may reveal that an attack on a constituent is more likely than before. External events may expose information that identifies new risks to assets for a period of time or require heightened detection activities. Overall the information helps provide actionable information to aid in decision making and incident handling.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Collection"*

Function: Data processing and preparation

Data processing and preparation includes transformation, processing, normalization, and validation of a set of data. Sources of cybersecurity data need to be validated for accuracy often due to a high number of false positives. The relevant data also typically comes in different formats, and new data needs to be combined with historical data before a complete analysis can be performed. Some types of data (such as news articles) may need to be analyzed or processed as part of the preparation process. One example would be extracting relevant security information from a news article (e.g., names, dates, places, technical information, weaknesses, system names) and comparing it with internal data for potential impacts. Some analysis methods require data to be stored in the same format, or for files to have the same number of records. There are multiple processing steps that may be involved to prepare the data. Data augmentation (also called enrichment) is performed by including other available information related to a given piece of data from other internal and external sources. For example, teams may collect information related to internet protocol addresses

(IP addresses) such as autonomous system identifiers, country codes, or geo-location data. For internal asset information, teams may enrich their asset inventory data with the name of the asset owner, their role, their permissions on other assets, their physical working location over time, and more.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Data processing and preparation"*

Function: Projection and inference

The process of inferring the current state of a situation and making predictions about the possible likely near-term pictures based on the status and dynamics of the collected data. Sometimes the data may quickly show a security issue.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Projection and inference"*

Function: Event detection (through alerting and/or hunting)

The systematic and often directed searching for anomaly activity inside and outside of network boundaries based upon external and internal information and trends. To assist the constituency with analyzing its data from sensors and other sources to draw conclusions about its environment and situation. For example, if an anti-virus sensor sends an alert of a suspicious file, the team may analyze the system configuration, the sensor configuration, the file that was alerted, the user activity at the time, and more, to draw a conclusion about the severity of the observation. This function may receive significant input from the Security Event Management service area. The observations from sensors that are used to detect events may be shared among multiple services. CSIRT teams also need to determine the current situational picture based upon specific pieces of information about threats. This activity may sometimes be called “threat hunting.” Typically, threat hunting involves either preparing the environment to detect specific threat activity, or searching for specific threat activity that may already be present.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Event detection (through alerting and/or hunting)"*

Function: Information security incident management decision support

Performing analysis of specific evidence assists in identifying insights to support incident resolution. Sometimes, CSIRTs may focus their situational analysis to support a specific desired outcome such as incident resolution. Certain responses to an incident may affect a situational picture differently, and responders may ask for analysis (e.g., impact, cost, risk of failure) of choices. The decision-making needs of the constituency may change as their situational picture evolves, and the CSIRT team may initiate new analysis processes to assist them. This activity is related to the Incident Management Service Area. Incident Management functions are supported by Situational Awareness and the situational picture may change based upon Incident Management activities.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Information security incident*

management decision support"

Function: Situational impact

This function identifies the impact a projection or inference may have upon a current or near-term future situation. An impact may include raising or lowering certain risks such as data loss, system downtime, or effects on data confidentiality/availability/integrity.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Situational impact"*

Function: Internal and external communication

Once the results of Analyze and Interpret are complete, they can be used to improve decision-making via both internal and external communication processes. Specific pieces of information are distributed based upon who needs to know them. Communication includes the method of delivery and the content that is being delivered. A CSIRT team might communicate new information and how it will change the situational picture. An example of this would be reporting the expected change a new malicious technique it has observed during an incident would have upon a constituent member. It may also include trend information such as the most useful sources of enrichment data and steps in which constituents can use it to improve their own situational awareness.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Internal and external communication"*

Function: Reporting and recommendations

Reports and recommendations should clearly indicate the choices and actions faced by constituents, and include analysis of the expected consequences of each choice or action. Communication of findings should include a list of evidence supporting the analysis and the recommendation (if a recommendation is made). The methods used to create the findings should be clearly explained to the audience so they can also judge the claims presented. The CSIRT team may create reports on a single event, a series of events, trends, patterns, possible events, or more to support the needs for their constituency to understand a situational picture.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Reporting and recommendations"*

Function: Implementation

In some instances, a CSIRT team may also perform the recommended adjustments to parts of the security infrastructure, for example changing the firewall rules on a particular honey pot based upon situational analysis.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Implementation"*

Function: Dissemination / integration / information sharing

This function may include the following sub-functions: using the results of the analysis service in internal and external planning and decision-making processes identifying the right targets to receive the information making the analysis results available ensuring the delivery is successful tracking and reporting on the sharing of information sending relevant information to the Knowledge Transfer service for further use and dissemination

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Dissemination / integration / information sharing"*

Function: Management of information sharing

This function may include the following sub-functions: providing information to other groups. formatting information for transfer. tracking transfer process and its outcome.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Management of information sharing"*

Function: Feedback

This function involves providing and receiving feedback on information provided, received, and used by the constituency, other service providers or other stakeholders. Was the information received accurate, applicable, timely, strategic, new/novel, etc.? Was it helpful in resolving an investigation? Did it lead to a new insight? This may mean providing information also to other CSIRT (as an external source) on the usefulness of or changes to signatures, honeypot findings, IOCs, warnings, threat information, mitigations, etc. This activity may also be performed by the Knowledge Transfer service area. If so, the results should be communicated back to the Situational Awareness service area.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Feedback"*

Function: Research and information aggregation

This function involves researching and aggregating information relevant for building awareness materials and reports, including from outcomes of other services/functions, especially from the Security Event Management, Incident Management, and Situational Awareness service areas.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Research and information aggregation"*

Function: Reports and awareness materials development

This function involves developing materials for diverse audiences (technical staff, management,

end users, etc.) and in various formats, such as presentations, short videos, cartoons, booklets, technical analysis, trend reports, and annual reports.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Reports and awareness materials development"*

Function: Information dissemination

The function involves implementing a process of information dissemination that can help the CSIRT to best deliver its reports and awareness materials to its constituency based on the characteristics of different audiences and content.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Information dissemination"*

Function: Outreach

This function involves building partnerships, promoting cooperation, and engaging key stakeholders, internal or external to the constituency, with the goal of: disseminating awareness and best practices; helping the constituency and external stakeholders understand the services and benefits a CSIRT can provide; helping the CSIRT to better understand constituents' needs; and enabling the realization of CSIRT's mission. This may involve ensuring interoperability or fostering collaboration between or across organizations.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Outreach"*

Function: Knowledge, skill, and ability requirements gathering

The function involves collecting knowledge, skill, and ability (KSA) needs and the competence of a constituency in regard to determining what training and education should be provided.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Knowledge, skill, and ability requirements gathering"*

Function: Educational and training materials development

This function involves building or acquiring content of educational and training materials such as presentations, lectures, demonstrations, simulations, videos, books, booklets, etc.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Educational and training materials development"*

Function: Content delivery

This function involves the transfer of knowledge and content to "students." This can occur via

various methods, such as computer-based/online training (CBT/WBT), instructor-led, virtual, conferences, presentations, labs, capture the flag (CTF) competitions, books, online videos, etc.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Content delivery"*

Function: Mentoring

A Mentoring program can help provide a formal as well as informal mechanism for the mentor to share with the mentee about education and skill development, insights, and life and career experiences outside of the official reporting relationship and structure of the team. This can involve on-site visits, rotation (exchange), shadowing, and discussing rationale for specific decisions and actions.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Mentoring"*

Function: CSIRT staff professional development

Once the appropriate skills have been identified, professional development is used by a CSIRT to promote a continuous process of securing new knowledge, skills, and abilities that relate to the security profession, unique job responsibilities, and the overall Team environment. This can include attending conferences, advanced training, and cross-training activities, among others.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: CSIRT staff professional development"*

Function: Requirements analysis

Determine the learning objectives and scope of the exercise. Define the specific services, capabilities, and topics to be covered by the exercise. Ensure exercise includes activities and topics that relate to required or desired skills needed by the participants, as well as the processes that should be tested.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Requirements analysis"*

Function: Format and environment development

Define the format and platform needed to meet the objectives and deliver the expected outcomes of the exercise.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Format and environment development"*

Function: Scenario development

Development of exercise scenarios in support of stakeholder objectives. Deliverables also include instructions and guidance to the participants and exercise managers; these instructions include recommended actions for the participants detailing some/all scenario steps.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Scenario development"*

Function: Exercises execution

The function involves performing readiness testing of constituent “students” to test their ability to apply training and perform job or task functions. Can be in the form of real or virtual environments, simulations, field tests, table tops, mock scenarios, or a combination, with injects being provided in a structured manner. This will also help determine the level at which the team is operating, as well as if and where it has room for improvement.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Exercises execution"*

Function: Exercise outcome review

Develop an after-action report which includes lessons learned or findings/best practices from the exercise, and provide an assessment to the stakeholders/management.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Exercise outcome review"*

Function: Risk management support

Support to activities related to assessing risk or compliance. This may include conducting an actual assessment or providing support to evaluate the results of an assessment.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Risk management support"*

Function: Business continuity and disaster recovery planning support

Support the constituency in the activities related to organizational resilience, based on risks identified.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Business continuity and disaster recovery planning support"*

Function: Policy support

This function supports the constituency in the development, maintenance, institutionalization, and enforcement of policies, while ensuring they enable and support incident management activities. For internal CSIRTs, this typically includes support for information security and other operating policies. For coordinating and National CSIRTs, this might include support for public policies and new legislation.

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Policy support"*

Function: Technical advice

This function provides support and recommendations for the improvement of cybersecurity related infrastructures, tools, and services for its constituency, with the goal of improving the security posture and incident management overall. This might include advice on security considerations for acquisition, compliance verification, maintenance, and upgrades internal and external audits of cybersecurity related infrastructures and tools secure software development requirements and secure coding

The tag is: *misp-galaxy:first-csirt-services-framework="Function: Technical advice"*

FIRST DNS Abuse Techniques Matrix

The Domain Name System (DNS) is a critical part of the Internet, including mapping domain names to IP addresses. Malicious threat actors use domain names, their corresponding technical resources, and other parts of the DNS infrastructure, including its protocols, for their malicious cyber operations. CERTs are confronted with reported DNS abuse on a continuous basis, and rely heavily on DNS analysis and infrastructure to protect their constituencies. Understanding the international customary norms applicable for detecting and mitigating DNS abuse from the perspective of the global incident response community is critical for the open Internet's stability, security and resiliency. See also https://www.first.org/global/sigs/dns/ for more information..

FIRST DNS Abuse Techniques Matrix is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

DGAs

DGAs - Domain Generation Algorithm

The tag is: *misp-galaxy:first-dns="DGAs"*

Table 1635. Table References

Links
https://attack.mitre.org/techniques/T1568/002/

Domain name compromise

The wrongfully taking control of a domain name from the rightful name holder. Compromised domains can be used for different kinds of malicious activity like sending spam or phishing, for distributing malware or as botnet command and control.

The tag is: *misp-galaxy:first-dns="Domain name compromise"*

Table 1636. Table References

Links
https://www.icann.org/groups/ssac/documents/sac-007-en

Lame delegations

Lame delegations occur as a result of expired nameserver domains allowing attackers to take control of the domain resolution by re-registering this expired nameserver domain.

The tag is: *misp-galaxy:first-dns="Lame delegations"*

Table 1637. Table References

https://blog.apnic.net/2021/03/16/the-prevalence-persistence-perils-of-lame-nameservers/

DNS cache poisoning

DNS cache poisoning - also known as DNS spoofing, is a type of cyber attack in which an attacker corrupts a DNS resolver's cache by injecting false DNS records, causing the resolver to records controlled by the attacker.

The tag is: *misp-galaxy:first-dns="DNS cache poisoning"*

Table 1638. Table References

Links
https://capec.mitre.org/data/definitions/142.html

DNS rebinding

DNS rebinding - a type of attack where a malicious website directs a client to a local network address, allowing the attacker to bypass the same-origin policy and gain access to the victim's local resources.

The tag is: *misp-galaxy:first-dns="DNS rebinding"*

Table 1639. Table References

Links

https://capec.mitre.org/data/definitions/275.html

DNS server compromise

Attacker gains administrative privileges on an open recursive DNS server, authoritative DNS server, organizational recursive DNS server, or ISP-operated recursive DNS server.

The tag is: *misp-galaxy:first-dns="DNS server compromise"*

Stub resolver hijacking

The attacker compromises the Operating System of a computer or a phone with malicious code that intercepts and responds to DNS queries with rogue or malicious responses.

The tag is: *misp-galaxy:first-dns="Stub resolver hijacking"*

Local recursive resolver hijacking

Consumer Premise Equipment (CPE), such as home routers, often provide DNS recursion on the local network. If the CPE device is compromised, the attacker can change the recursive resolver behavior; for example, by changing responses.

The tag is: *misp-galaxy:first-dns="Local recursive resolver hijacking"*

On-path DNS attack

Attackers intercept communication between a user and a DNS server and provide different destination IP addresses pointing to malicious sites.

The tag is: *misp-galaxy:first-dns="On-path DNS attack"*

Table 1640. Table References

Links
https://www.imperva.com/learn/application-security/dns-hijacking-redirection/

DoS against the DNS

Multiple systems sending malicious traffic to a target at the same time.

The tag is: *misp-galaxy:first-dns="DoS against the DNS"*

DNS as a vector for DoS

Adversaries may attempt to cause a denial of service by reflecting a high-volume of network traffic to a target. This type of Network DoS takes advantage of a third-party server intermediary that hosts and will respond to a given spoofed source IP address. This third-party server is commonly

termed a reflector. An adversary accomplishes a reflection attack by sending packets to reflectors with the spoofed address of the victim. Two prominent protocols that have enabled Reflection Amplification Floods are DNS and NTP through the use of several others in the wild have been documented. These Reflection and Amplification Floods can be directed against components of the DNS, like authoritative nameservers, rendering them unresponsive.

The tag is: *misp-galaxy:first-dns="DNS as a vector for DoS"*

Table 1641. Table References

Links
https://attack.mitre.org/techniques/T1498/002/

Dynamic DNS resolution

Dynamic DNS resolution (as obfuscation technique) - Adversaries may dynamically establish connections to command and control infrastructure to evade common detections and remediations. This may be achieved by using malware that shares a common algorithm with the infrastructure the adversary uses to receive the malware's communications. These calculations can be used to dynamically adjust parameters such as the domain name IP address or port number the malware uses for command and control.

The tag is: *misp-galaxy:first-dns="Dynamic DNS resolution"*

Table 1642. Table References

Links
https://attack.mitre.org/techniques/T1568/

Dynamic DNS resolution: Fast flux

Dynamic DNS resolution: Fast flux (as obfuscation technique) - Adversaries may use Fast Flux DNS to hide a command and control channel behind an array of rapidly changing IP addresses linked to a single domain resolution. This technique uses a fully qualified domain name with multiple IP addresses assigned to it which are swapped with high frequency using a combination of round robin IP addressing and short Time-To-Live (TTL) for a DNS resource record.

The tag is: *misp-galaxy:first-dns="Dynamic DNS resolution: Fast flux"*

Table 1643. Table References

Links
https://attack.mitre.org/techniques/T1568/001/

Infiltration and exfiltration via the DNS

Exfiltration via the DNS requires a delegated domain or, if the domain does not exist in the public DNS, the operation of a resolver preloaded with that domain's zone file information and configured

to receive and respond to the queries sent by the compromised devices.

The tag is: *misp-galaxy:first-dns="Infiltration and exfiltration via the DNS"*

Malicious registration of (effective) second level domains

For example, before attacking a victim, adversaries purchase or register domains from an ICANN-accredited registrar that can be used during targeting. See also CAPEC-630.

The tag is: *misp-galaxy:first-dns="Malicious registration of (effective) second level domains"*

Table 1644. Table References

Links
https://capec.mitre.org/data/definitions/630.html

Creation of malicious subdomains under dynamic DNS providers

Before attacking a victim, adversaries purchase or create domains from an entity other than a registrar or registry that provides subdomains under domains they own and control. S

The tag is: *misp-galaxy:first-dns="Creation of malicious subdomains under dynamic DNS providers"*

Table 1645. Table References

Links
https://en.wikipedia.org/wiki/Dynamic_DNS

Compromise of a non-DNS server to conduct abuse

- Internet attack infrastructure is a broad category, and this covers any non-DNS server. Many compromised servers, such as web servers or mail servers, interact with the DNS or may be instrumental in conducting DNS abuse. For example, compromised mail servers are one technique that may be used to send phishing emails.

The tag is: *misp-galaxy:first-dns="Compromise of a non-DNS server to conduct abuse"*

Spoofing or otherwise using unregistered domain names

In a context where a domain name is expected (such as the From header in mail or a URL in a web page or message body), supplying a domain name not controlled by the attacker and that is not controlled by or registered to a legitimate registrant.

The tag is: *misp-galaxy:first-dns="Spoofing or otherwise using unregistered domain names"*

Spoofing of a registered domain

In a context where a domain name is expected (such as the From header in mail or a URL in a web page or message body), supplying a domain name not controlled by the attacker and that is in fact controlled by or registered to a legitimate registrant.

The tag is: *misp-galaxy:first-dns="Spoofing of a registered domain"*

DNS tunneling

DNS tunneling - tunneling another protocol over DNS - The DNS protocol serves an administrative function in computer networking and thus may be very common in environments. DNS traffic may also be allowed even before network authentication is completed. DNS packets contain many fields and headers in which data can be concealed. Often known as DNS tunneling, adversaries may abuse DNS to communicate with systems under their control within a victim network while also mimicking normal expected traffic.

The tag is: *misp-galaxy:first-dns="DNS tunneling"*

Table 1646. Table References

Links
https://attack.mitre.org/techniques/T1071/004/

DNS beacons - C2 communication

DNS beacons - C2 communication - Successive or periodic DNS queries to a command & control server, either to exfiltrate data or await further commands from the C2.

The tag is: *misp-galaxy:first-dns="DNS beacons - C2 communication"*

GSMA MoTIF

Mobile Threat Intelligence Framework (MoTIF) Principles. .

GSMA MoTIF is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

GSMA

Monitor Radio Interface

The adversaries may monitor radio interface traffic to passively collect information about the radio

network configuration or about subscribers in close vicinity of the adversary. (1), (2), (3), (4).

The tag is: *misp-galaxy:gsma-motif="Monitor Radio Interface"*

Table 1647. Table References

Gather Victim Identity Information

Adversaries may gather information about the victim's identity that can be used during targeting. Information about identities may include a variety of details, including personal data (ex: employee names, email addresses, etc.) as well as sensitive details such as credentials. In mobile networks,

the adversary wants to obtain information about subscriber and phone identities to conduct more targeted attacks. Subscriber identity can be, for example, MSISDN, IMSI, GUTI, TMSI.

The tag is: *misp-galaxy:gsma-motif="Gather Victim Identity Information"*

Table 1649. Table References

ATT&CK Enterprise: Gather Victim Identity Information (T1589)[ATT&CK Enterprise: Gather Victim Identity Information (T1589)]

Phone and Subscription Information

In mobile networks, targeted attacks towards subscribers have to be done using the subscriber identity. Obtaining the identity would allow the attacker to gather more information or initiate more targeted attacks. The adversary gathers phone or subscription related information about subscriber(s). Examples are phone number (MSISDN), IMSI (International Mobile Subscriber Identity), home mobile network operator, S@T browser availability on the UICC, IMEI (International Mobile Equipment Identity). The data might be acquired through interconnection, social engineering, social media or otherwise. (1)

The tag is: *misp-galaxy:gsma-motif="Phone and Subscription Information"*

Network Service Scanning

An adversary may discover operator network related information (identifiers). Adversaries may attempt to get a listing of services running on remote hosts and local network infrastructure devices, including those that may be vulnerable to remote software exploitation. Common methods to acquire this information include port and/or vulnerability scans using tools that are brought onto a system. In mobile networks, the adversary wants to obtain information about subscriber,

signalling addresses, supported service at a certain server. The scan may take place from the Internet or the interconnection network or the radio network. Often automated mass scanning events take place.

The tag is: *misp-galaxy:gsma-motif="Network Service Scanning"*

Scan Signalling Addresses

By sending signalling messages to the network, the adversary tries to check if mobile network nodes leak node or network related information, or bypasses defences ((1) (2) below). Using this sub-technique as a preparatory step, the adversary can then tune his further attack steps to send specific attack messages based on this scan. Examples are SS7 scans to evaluate if a Global Title is in use or not. The adversary may also probe which PLMN-ID values are accepted by the HPLMN in Diameter Authentication Information Request (AIR).

The tag is: *misp-galaxy:gsma-motif="Scan Signalling Addresses"*

ATT&CK Enterprise: IP Block Scanning (T1595.001)[ATT&CK Enterprise: IP Block Scanning (T1595.001)]

Search Closed Sources

Adversaries may search and gather information about victims from closed sources that can be used during targeting. Information about victims may be available for purchase from reputable private sources and databases, such as paid subscriptions to feeds of technical/threat intelligence data. Adversaries may also purchase information from less-reputable sources such as dark web or

cybercrime black markets. Adversaries may search and collect information about the mobile network operator from closed or semi-closed sources. Typical examples are GSMA IR.21, IR.85, FS.30 or T-ISAC, information from insiders or partners. The information acquisition might be done legally or illegally.

The tag is: *misp-galaxy:gsma-motif="Search Closed Sources"*

Table 1653. Table References

Acquire Infrastructure

Adversaries may buy, lease, or rent infrastructure that can be used during targeting. For example, commercial service providers exist that offer access to signalling infrastructure or sell False Base Station solutions. Use of these infrastructure solutions allows an adversary to stage, launch, and execute operations. Solutions may help adversary operations blend in with traffic that is seen as normal.

The tag is: *misp-galaxy:gsma-motif="Acquire Infrastructure"*

ATT&CK Enterprise: Acquire Infrastructure (T1583)[ATT&CK Enterprise: Acquire Infrastructure (T1583)]

Core Signalling Infrastructure Access

Adversaries may buy, lease, or rent SS7, Diameter, GTP-C signalling infrastructure access or services that can be used during targeting (1), (2), (3). Targeted attacks to mobile network operators may use 'surveillance as a service' specialists to achieve their goals (2). Their attacks often blend in with normal traffic coming from partners of the victim mobile network operator and make attribution difficult. Fraudsters and spammers may use specific partner gateways or access to messaging servers for their purposes.

The tag is: *misp-galaxy:gsma-motif="Core Signalling Infrastructure Access"*

(4) Enea (2021) 5G Network Slicing Security in 5G Core Networks (5) Mobileum (2023) OAuth2.0 Security and Protocol Exploit Analysis in 5G Ecosystem]

Radio Interface Access

Adversaries may buy, lease, or obtain physical access to a mobile operator network base station or use their own rogue cellular base (Stingray) station for launching an attack (2) (3). The adversary could set up a rogue cellular base station infrastructure and then use it to eavesdrop on or manipulate cellular device communication. A compromised cellular femtocell could be used to carry out this technique (1).

Develop Capabilities

Adversaries may build capabilities that can be used during targeting. Rather than purchasing, freely downloading, or stealing capabilities, adversaries may develop their own capabilities in-house. This is the process of identifying development requirements and building solutions such as malware, exploits, and self-signed certificates. Adversaries may develop capabilities to support their operations throughout numerous phases of the adversary lifecycle. In mobile networks adversary may develop false base stations (1), mobile exploits, core signalling exploitation tools (2), SIM card exploits, radio exploitation tools and other tools to initiate attacks.

Trusted Relationship

Adversaries may breach or otherwise leverage organizations who have access to intended victims. Access through trusted third-party relationship exploits an existing connection that may not be protected or requires more complicated defence mechanisms to detect and prevent unauthorized access to a network. (1) (2)

The tag is: *misp-galaxy:gsma-motif="Trusted Relationship"*

Identify Subscriber

An adversary may obtain a subscriber permanent or temporary identifier via various means. An adversary may obtain the subscriber identifier by using HLR Lookup, or by monitoring the radio interface. An adversary may obtain identifying information from 5G UEs only after the UE has been bid down (downgraded) to a lower security protocol e.g. 4G, since in 4G and 3G it is possible for the network to ask the UE to send its IMSI (International Subscriber Identifier) in the clear over the radio interface. The 5G UE sends an encrypted permanent identifier (called Subscriber Concealed Identifier (SUCI)) over the radio interface as part of the initial registration to the 5G network. Some non-UE specific information is part of the Subscriber Permanent Identifier or SUPI and is not encrypted (e.g., home network name).

The tag is: *misp-galaxy:gsma-motif="Identify Subscriber"*

Radio Interface

An adversary may eavesdrop on unencrypted or encrypted traffic to capture information to and from a UE. An adversary may employ a back-to-back false base station to eavesdrop on the communication and relay communication between the intended recipient and the intended source, over the radio interface. The adversary may also passively sniff the radio traffic and capture specific traffic that can be then, if possible, analyzed.(1) When operating a false base station the adversary needs to obtain information about the cell configuration parameters that will be used to prepare for the next phase of an attack that is utilizing the radio interface. Example of

configuration could be the Physical Cell ID (PCI), neighbouring cells, frequencies used, Location Area Codes/Tracking Area Codes (LAC/TAC).(2) The adversary may use methods of capturing control plane or user plane traffic on the radio interface.

The tag is: *misp-galaxy:gsma-motif="Radio Interface"*

Supply Chain Compromise

Adversaries may manipulate products or product delivery mechanisms prior to receipt by a final consumer for the purpose of data or system compromise. Supply chain compromise can take place at any stage of the supply chain including: • Manipulation of development tools • Manipulation of a development environment • Manipulation of source code repositories (public or private) • Manipulation of source code in open-source dependencies • Manipulation of software update/distribution mechanisms • Compromised/infected system images (multiple cases of removable media infected at the factory)(1) (2) • Replacement of legitimate software with modified versions • Sales of modified/counterfeit products to legitimate distributors • Shipment interdiction While supply chain compromise can impact any component of hardware or software, adversaries looking to gain execution have often focused on malicious additions to legitimate software in software distribution or update channels.

The tag is: *misp-galaxy:gsma-motif="Supply Chain Compromise"*

Compromise Software Supply Chain

Adversaries may manipulate application software prior to receipt by a final consumer for the purpose of data or system compromise. Supply chain compromise of software can take place in a number of ways, including manipulation of the application source code, manipulation of the update/distribution mechanism for that software, or replacing compiled releases with a modified version.

The tag is: *misp-galaxy:gsma-motif="Compromise Software Supply Chain"*

Exploitation for Credential Access

Adversaries may exploit software vulnerabilities in an attempt to collect credentials. Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code.

INTERPOL DWVA Taxonomy

This taxonomy defines common forms of abuses and entities that represent real-world actors and service that are part of a larger Darknet- and Cryptoasset Ecosystems..

INTERPOL DWVA Taxonomy is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

INTERPOL Darkweb and Virtual Assets Working Group

Decentralized Apps

An application that does not rely on a central server but on several decentralized nodes. Each user can choose to be an active node serving the app.

The tag is: *misp-galaxy:dwva="Decentralized Apps"*

Hardware Wallet

A [hardware] cryptocurrency wallet is a device, physical medium, (...) which stores the private keys for cryptocurrency transactions. It will normally also contain the associated public keys.

The tag is: *misp-galaxy:dwva="Hardware Wallet"*

Distributed Hash Technology

A decentralized distributed system that provides sharing contact information, so people downloading the same file can discover each other. Both Tor and I2P use DHT. Due to the distributed nature of the hidden services domain resolution, it is possible to deploy nodes in the DHT to monitor requests coming from a given domain.

The tag is: *misp-galaxy:dwva="Distributed Hash Technology"*

Bitcoin

Bitcoin is a network protocol based on blockchain, introduced by Nakamoto [11] which allows payments and coin transfers to be made among participating entities. No trusted

The tag is: *misp-galaxy:dwva="Bitcoin"*

Counterfeit product

Counterfeit consumer goods are goods, often of inferior quality, made or sold under another's brand name without the brand owner's authorization.

The tag is: *misp-galaxy:dwva="Counterfeit product"*

Shop owner

A shop owner is an actor within the group of Criminal Actors; operating a DW shop.

The tag is: *misp-galaxy:dwva="Shop owner"*

Hierarchically Deterministic wallets

An HD (Hierarchical Deterministic) Wallet is a tree of private/public keypairs starting from a master seed. This technology provides both account management and identity masking. A user only needs to keep the master seeds because she can generate following keypairs from the root key deterministically, and each public key that can be exposed is changed for each transaction.

The tag is: *misp-galaxy:dwva="Hierarchically Deterministic wallets"*

Non Fungible Token

A non-fungible token (NFT) is a unit of data stored on a digital ledger, called a blockchain, that certifies a digital asset to be unique and therefore not interchangeable. NFTs can be used to represent items such as photos, videos, audio, and other types of digital files.

The tag is: *misp-galaxy:dwva="Non Fungible Token"*

Table 2099. Table References

Links
https://en.wikipedia.org/wiki/Non-fungible_token

Bulletproof Hosting

A (hosting) service that guarantees the availability of hosted resources even when they are found to be malicious or illegal.

The tag is: *misp-galaxy:dwva="Bulletproof Hosting"*

Darknet Wiki

Wiki services, including directory services for other hidden services, hosted in the Dark Web.

The tag is: *misp-galaxy:dwva="Darknet Wiki"*

Proof of Stake

In a Proof of Stake (PoS) network, users need to prove ownership of enough stakes to become validators. Ethereum (ETH) is moving from PoW to PoS. PoS offers several advantages over PoW: it is energy efficient, reduces hardware requirements and is less prone to centralisation

The tag is: *misp-galaxy:dwva="Proof of Stake"*

Multisig

Multisig refers to all the transactions that require two or more signatures. Multisignature transactions and addresses are validated only when at least x of the possible y signatories have

signed. x and y are defined at creation.

The tag is: *misp-galaxy:dwva="Multisig"*

Zcash

A cryptocurrency with a decentralized Blockchain that provides anonymity for its users and their transactions. It is similar to Bitcoin as an open-source, but their major differences are the increased level of privacy it provides.

The tag is: *misp-galaxy:dwva="Zcash"*

Finalize Early

Buyers may "finalize early" (FE), releasing funds from escrow to the vendor prior to receiving their goods in order to expedite a transaction. This can be done when there is a trust relationship between vendor and buyer, however it does leave the buyer vulnerable to fraud if they choose to do so.

The tag is: *misp-galaxy:dwva="Finalize Early"*

Coin swapping

CoinSwap is a protocol to make a transaction via a third party to obfuscate the money flow. For instance, when Alice would like to pay Bob, Carol offers to receive Alice's coin and pay Bob with an unconnected coin. While none of these parties trusts each other, this protocol does not allow Carol to rob Alice's coin.

The tag is: *misp-galaxy:dwva="Coin swapping"*

Ripple

Ripple is a real-time gross settlement system, currency exchange and remittance network created by Ripple Labs Inc., a US-based technology company. (...) The ledger employs the native cryptocurrency known as XRP.

The tag is: *misp-galaxy:dwva="Ripple"*

Vendor

Someone who is selling something.

The tag is: *misp-galaxy:dwva="Vendor"*

Table 2100. Table References

Links
https://dictionary.cambridge.org/dictionary/english/vendor

Initial Coin Offering / Initial Crypto-Tokens Offering

Initial Coin Offerings (ICO) are public offers of new cryptocurrencies in exchange of existing ones, aimed to finance projects in the blockchain development arena. The typical pattern is for a startup to produce a white paper that describes their business model and technical approach. The white paper includes details about the functions that the tokens issued during the ICO will perform and the process of token creation.

The tag is: *misp-galaxy:dwva="Initial Coin Offering / Initial Crypto-Tokens Offering"*

Layer 2

Layer 2 is a collective term for solutions designed to help scale decentralised applications by handling transactions off the Ethereum mainnet (layer 1), while taking advantage of the robust decentralized security model of mainnet.

The tag is: *misp-galaxy:dwva="Layer 2"*

Table 2101. Table References

Links
https://ethereum.org/en/developers/docs/scaling/layer-2-rollups

Virtual Asset Service Provider

Virtual asset service provider means any natural or legal person who (...) as a business conducts one or more of the following activities or operations for or on behalf of another natural or legal person: i) exchange between virtual assets and fiat currencies; ii) exchange between one or more forms of virtual assets; iii) transfer of virtual assets; iv) safekeeping and/or administration of virtual assets or instruments enabling control over virtual assets; and v) participation in and provision of financial services related to an issuer's offer and/or sale of a virtual asset.

The tag is: *misp-galaxy:dwva="Virtual Asset Service Provider"*

Decentralized Exchange

Same as exchange but in a completely distributed environment. There is no central hosting server and all nodes are servers.

The tag is: *misp-galaxy:dwva="Decentralized Exchange"*

Metadata

Refers to data that provides information about a certain item's content. For example, an image may include information that describes how large the picture is or when the image was created, while a text document may contain information about the author of the document, or the IP address of the document's author, and so on.

The tag is: *misp-galaxy:dwva="Metadata"*

Exit scam

An exit scam can be performed by a dark net martket or single vendor shop and is the process in which the one or more of the market admins prevents users withdrawing funds through the escrow system and then closes the market, exiting with all the bitcoins and other digital currencies they were holding in escrow.

The tag is: *misp-galaxy:dwva="Exit scam"*

Smart contract

A smart contract is a self-executing contract with the terms of the agreement between buyer and seller being directly written into lines of code. The code and the agreements contained therein exist across a distributed, decentralized blockchain network. The code controls the execution, and transactions are trackable and irreversible.

The tag is: *misp-galaxy:dwva="Smart contract"*

Service Provider

An actor that provides a service by making available and managing infrastructure or by executing a process

The tag is: *misp-galaxy:dwva="Service Provider"*

Administrator

An actor whose job it is to supervise the technical operation of a service

The tag is: *misp-galaxy:dwva="Administrator"*

Virtual Asset

A virtual asset is a digital representation of value that can be digitally traded, or transferred, and can be used for payment or investment purposes. Virtual assets do not include digital representations of fiat currencies, securities and other financial assets that are already covered elsewhere in the FATF Recommendations.

The tag is: *misp-galaxy:dwva="Virtual Asset "*

Darknet Forum

Forum services hosted in the Dark Web.

The tag is: *misp-galaxy:dwva="Darknet Forum"*

Shop

A shop is a service where products from one actor (the shop owner) are traded.

The tag is: *misp-galaxy:dwva="Shop"*

Hosted wallet

A digital account hosted by third party financial institution, known as Virtual Asset Service Provider(VASP), which allows the account-holder (the user) to store, send, and receive cryptocurrency.

The tag is: *misp-galaxy:dwva="Hosted wallet"*

Table 2102. Table References

Links
https://home.treasury.gov/system/files/136/2020-12-18-FAQs.pdf

.Onion

A special-use top level domain name designating an anonymous onion service, which was formerly known as a "hidden service". It is referred to as that because of the “layered” approach to relays on the Tor Browser.

The tag is: *misp-galaxy:dwva=".Onion"*

Bridge

Blockchain bridges enable interoperability between vastly different networks, such as Bitcoin and Ethereum, and between one parent blockchain and its sidechains.

The tag is: *misp-galaxy:dwva="Bridge"*

Table 2103. Table References

Links
https://blog.makerdao.com/what-are-blockchain-bridges-and-why-are-they-important-for-defi/

Unhosted wallet

A wallet that is not hosted by a third-party financial system. It can be very difficult or impossible to determine who is accessing or in control of the use of cryptocurrencies in an unhosted wallet. Unhosted wallets allow for anonymity and concealment of illicit financial activity.

The tag is: *misp-galaxy:dwva="Unhosted wallet"*

Table 2104. Table References

Links
https://home.treasury.gov/system/files/136/2020-12-18-FAQs.pdf

Drop Ship

A vending tactic involving the vendor passing the buyer's address on to another vendor to ship to, eliminating any need for the middleman (dropshipper) to handle anything illegal in person.

The tag is: *misp-galaxy:dwva="Drop Ship"*

Table 2105. Table References

Links
DNM Bible Glossary[DNM Bible Glossary]

Sidechain

A sidechain is a side blockchain that is linked to another blockchain, referred to as the main chain, via a two-way peg.

The tag is: *misp-galaxy:dwva="Sidechain"*

Table 2106. Table References

Links
https://coinmarketcap.com/alexandria/glossary/side-chain

Flash Loan

A cryptocurrency loan executed trough a smart contract, with no collateral, that must be paid back in the same block. The purpose of a flash loan is to gain money through arbitrage (on different exchanges or different assets) without providing any collateral.

The tag is: *misp-galaxy:dwva="Flash Loan"*

Table 2107. Table References

Links
https://www.coindesk.com/what-is-a-flash-loan

Escrow

An escrow is a contractual arrangement in which a third party (the stakeholder or escrow agent) receives and disburses money or property for the primary transacting parties, with the disbursement dependent on conditions agreed to by the transacting parties.

The tag is: *misp-galaxy:dwva="Escrow"*

Proof of Work

Bitcoin blockchain is constructed and validated by computation. Miners work to validate the blockchain with their computation power, proving their work for a reward. The Bitcoin Blockchain is based on Proof-of-Work.

The tag is: *misp-galaxy:dwva="Proof of Work"*

Tumbler

A method of scrambling or anonymizing the source of one's cryptocurrencies.

The tag is: *misp-galaxy:dwva="Tumbler"*

Unspent Transaction Output

An unspent transaction output of cryptocurrencies. This output is considered as an input to new transaction.

The tag is: *misp-galaxy:dwva="Unspent Transaction Output"*

Crypto-assets

A crypto-asset (...) is a digital asset designed to work as a medium of exchange wherein individual coin ownership records are stored in a ledger existing in a form of a computerized database using strong cryptography to secure transaction records, to control the creation of additional coins, and to verify the transfer of coin ownership.

The tag is: *misp-galaxy:dwva="Crypto-assets"*

Bitcoin cash

Bitcoin Cash is a cryptocurrency that is a fork of Bitcoin. Bitcoin Cash is a spin-off or altcoin that was created in 2017.

The tag is: *misp-galaxy:dwva="Bitcoin cash"*

FIAT currencies

Fiat money is a currency (a medium of exchange) established as money, often by government regulation. Fiat money does not have intrinsic value and does not have use value. It has value only because a government maintains its value, or because parties engaging in exchange agree on its value.

The tag is: *misp-galaxy:dwva="FIAT currencies"*

Crypto ATM

A Bitcoin ATM (Automated Teller Machine) is a kiosk that allows a person to purchase Bitcoin and other cryptocurrencies by using cash or debit card. Some types of ATM also allow users to sell their cryptocurrency, dispensing cash in payment. Depending on the provider, the ATM can require KYC verification.

The tag is: *misp-galaxy:dwva="Crypto ATM"*

Ethereum

Ethereum is a decentralized, open-source blockchain with smart contract functionality. Ether (ETH) is the native cryptocurrency of the platform. It is the second-largest cryptocurrency by market capitalization, after Bitcoin. Ethereum is the most actively used blockchain.

The tag is: *misp-galaxy:dwva="Ethereum"*

Yield farming

A process that lets you earn either fixed or variable interest by investing crypto in a DeFi market.

The tag is: *misp-galaxy:dwva="Yield farming"*

Table 2108. Table References

Links
https://decrypt.co/resources/what-is-yield-farming-beginners-guide

Invisible Internet Protocol

An “anonymous overlay network” using the garlic routing protocol that encrypts multiple messages together to make data traffic analysis difficult, while simultaneously increasing network traffic speed. Each encrypted message has its own specific delivery instruction, and each endpoint works as a cryptographic identifier or what we refer to as “keys.” Since I2P is entirely peer-to-peer in structure, there’s no hard-coded trusted set of directory stores. Instead, the network directory of I2P is netDb, a distributed database that is replicated across the network.

The tag is: *misp-galaxy:dwva="Invisible Internet Protocol"*

Regulator

Authority that defines (national) regulations

The tag is: *misp-galaxy:dwva="Regulator"*

Hidden Service

A collective name used to describe websites which require a special browser in order to access.

The tag is: *misp-galaxy:dwva="Hidden Service"*

Relay (node)

A relay is a node in the Tor network. When a request to access a particular hidden service is made, the browser calculates the optimal route through a series of relays, exchanging cryptographic keys between nodes, to display the content without disclosing the IP address of the request originator. Each relay decrypts a layer of encryption to reveal the next relay in the circuit to pass the remaining encrypted data on to it. The final relay decrypts the innermost layer of encryption and sends the original data to its destination without revealing or knowing the source IP address.

The tag is: *misp-galaxy:dwva="Relay (node)"*

Bitcoin Improvement Proposals

Bitcoin improvement proposals, these are the equivalent of RFCs. They define the protocols and structures of Bitcoin. They are developed and maintained at the Bitcoin Github.

The tag is: *misp-galaxy:dwva="Bitcoin Improvement Proposals"*

Decentralized Finances

Smart Contracts on blockchains, DApps, mainly via the Ethereum technology and network. They are used to provide traditional financial services. The technology provides strong immunity against attackers and some level of anonymity and privacy. Transactions are confirmed relatively fast, but mostly lack KYC and AML compliance controls and offer limited to no user support and customer care. Current DeFi innovations include: Lending platforms; Prediction markets; Decentralised Exchange (DEXs); Staking and pooling platforms.

The tag is: *misp-galaxy:dwva="Decentralized Finances"*

Customer

The end user of a service. Customer would be paying for the services (buying good, using a service, owning an asset…).

The tag is: *misp-galaxy:dwva="Customer"*

Litecoin

Litecoin (LTC or Ł) is a peer-to-peer cryptocurrency and open-source software project released under the MIT/X11 license. Litecoin was an early bitcoin spinoff or altcoin, starting in October 2011. In technical details, Litecoin is nearly identical to Bitcoin.

The tag is: *misp-galaxy:dwva="Litecoin"*

Cyberterrorist

Cyberterrorism is the use of the Internet to conduct violent acts that result in, or threaten, loss of life or significant bodily harm, in order to achieve political or ideological gains through threat or intimidation.

The tag is: *misp-galaxy:dwva="Cyberterrorist"*

Tether

Tether is a controversial cryptocurrency with tokens issued by Tether Limited. It formerly falsely claimed that each token was backed by one United States dollar, but on 14 March 2019 changed the backing to include loans to affiliate companies.

The tag is: *misp-galaxy:dwva="Tether"*

Bank

A bank is a financial institution that accepts deposits from the public and creates a demand deposit while simultaneously making loans.

The tag is: *misp-galaxy:dwva="Bank"*

Monero

An open-source cryptocurrency created in April 2014 that focuses on fungibility, privacy and decentralization. Monero (XMR) uses an obfuscated public ledger, meaning anybody can broadcast or send transactions, but no outside observer can tell the source, amount or destination.

The tag is: *misp-galaxy:dwva="Monero"*

Binance Coin

BNB powers the Binance Ecosystem. As the native coin of Binance Chain, BNB has multiple use cases: fueling transactions on the Chain, paying for transaction fees on Binance Exchange, making in-store payments, and many more.

The tag is: *misp-galaxy:dwva="Binance Coin"*

Invisible Internet protocol network

A type of anonymity network similar to Tor, based on the Invisible Internet Project protocol.

The tag is: *misp-galaxy:dwva="Invisible Internet protocol network"*

Darknet market

A darknet market is a commercial website on the web that operates via darknets such as Tor or I2P. They function primarily as black markets, selling or brokering transactions involving drugs, cyber-arms, weapons, counterfeit currency, stolen credit card details, forged documents, unlicensed pharmaceuticals, steroids, and other illicit goods as well as the sale of legal products.

The tag is: *misp-galaxy:dwva="Darknet market"*

Pretty Good Privacy

An abbreviation for Pretty Good Privacy, an encryption program popular for encrypting emails and files. Through the use of public and private keys, it allows users who have never met to send encrypted messages etc. to each other without exchanging private encryption keys.

The tag is: *misp-galaxy:dwva="Pretty Good Privacy"*

Takedown notice

Notice and take down is a process operated by online hosts in response to court orders or allegations that content is illegal. Content is removed by the host following notice.

The tag is: *misp-galaxy:dwva="Takedown notice"*

Victim

Someone or something that has been hurt, damaged, or killed or has suffered, either because of the actions of someone or something else, or because of illness or chance.

The tag is: *misp-galaxy:dwva="Victim"*

Table 2109. Table References

Links
https://dictionary.cambridge.org/dictionary/english/victim

Polkadot

Polkadot is a heterogeneous multi-chain interchange and translation architecture which enables customised side-chains to connect with public blockchains.

The tag is: *misp-galaxy:dwva="Polkadot"*

Bank credentials

Login credentials for e-services that are provided by financial institutions with a bank license.

The tag is: *misp-galaxy:dwva="Bank credentials"*

Money mule

A money mule, sometimes called a "smurfer," is a person who transfers money acquired illegally in person, through a courier service, or electronically, on behalf of others. Typically, the mule is paid for services with a small part of the money transferred.

The tag is: *misp-galaxy:dwva="Money mule"*

Internet Relay Chat

A text-based chat service enabling users connected to a server to communicate with each other in real-time.

The tag is: *misp-galaxy:dwva="Internet Relay Chat"*

Software wallet

A [software] cryptocurrency wallet is a (...) program or a service which stores the private keys for cryptocurrency transactions. It will normally also contain the associated public keys.

The tag is: *misp-galaxy:dwva="Software wallet"*

Cardano

Cardano is a public blockchain platform. It is open source and decentralized, with consensus achieved using proof of stake. It can facilitate peer-to-peer transactions with its internal cryptocurrency Ada.

The tag is: *misp-galaxy:dwva="Cardano"*

Dogecoin

Dogecoin (code: DOGE, symbol: Đ) is a cryptocurrency created by software engineers Billy Markus and Jackson Palmer, who decided to create a payment system that is instant, fun, and free from traditional banking fees.

The tag is: *misp-galaxy:dwva="Dogecoin"*

Exchange

Trading platform (commonly referred to as an “Exchange”) is the term within this paper used to describe any venue which facilitates the exchange of tokens for any form of money or asset. Trading platforms provide services to buy and sell tokens and/or for exchange of national (fiat) currencies backed by central banks.

The tag is: *misp-galaxy:dwva="Exchange"*

Blockchain

Blockchain is a distributed technology built under peer-to-peer network principles and cryptographic primitives, such as asymmetric encryption and digital signature. It allows trust-less users to exchange information and record transactions without external interference and coordination.

The tag is: *misp-galaxy:dwva="Blockchain"*

Darknet Email Service

Messaging services hosted or accessible via privacy enhanced networks.

The tag is: *misp-galaxy:dwva="Darknet Email Service"*

Credentials

A credential is a piece of any document that details a qualification, competence, or authority issued to an individual by a third party with a relevant or de facto authority or assumed competence to do so.

The tag is: *misp-galaxy:dwva="Credentials"*

Rug pull

A rug pull is a malicious maneuver in the cryptocurrency industry where crypto developers abandon a project and run away with investors' funds

The tag is: *misp-galaxy:dwva="Rug pull"*

Table 2110. Table References

Links
https://coinmarketcap.com/alexandria/glossary/rug-pull

Moderator

A person who manages the discussion contributions in an online forum.

The tag is: *misp-galaxy:dwva="Moderator"*

TOR Network

A network of routers that adds encryption to conceal a web user's location and usage so that these are resistant to surveillance and hence are truly anonymous. The domain names of these hidden sites all end in '.onion' and they are only accessible by using a Tor browser. Tor stands for 'The Onion Router'.

The tag is: *misp-galaxy:dwva="TOR Network"*

ZeroNet

One of the newest Darknets, becoming increasingly popular. It is a combination of trackerless Bittorrent and a Blockchain for persistent site and user identity. ZeroNet optionally uses the Tor network as a virtual private network. As a full mesh network, all clients are also servers. By browsing to a “zite” as they are known in ZeroNet lingo, the machine used automatically becomes one of the servers for this zite also.

The tag is: *misp-galaxy:dwva="ZeroNet"*

Dead drop

The dead drop is a delivery model used by some vendors to distribute their products. A vendor uses a ‘dropman’ to hide consignments of pre-packaged drug deals in a number of suitably discreet offline locations. When a buyer makes a purchase from the vendor the geo-coordinates are provided to them for them to collect their order.

The tag is: *misp-galaxy:dwva="Dead drop"*

Coinjoin

Coinjoin is a method of mixing cryptocurrency tokens or coins, where two or more user transactions are combined into a single transaction on the blockchain, with multiple inputs and outputs. The concept behind that methodology is to obfuscate the link between an input and an output that would otherwise be apparent in a standard, single-user transaction. The coinjoin methodology is open-source and integrated into some software wallets, and is also available for use via a hosted online service.

The tag is: *misp-galaxy:dwva="Coinjoin"*

Paste site/service

A pastebin or text storage site is a type of online content hosting service where users can store plain text, e.g. to source code snippets for code review via Internet Relay Chat (IRC).

The tag is: *misp-galaxy:dwva="Paste site/service"*

Deep Web

The deep web, invisible web, or hidden web are parts of the World Wide Web whose contents are not indexed by standard web search-engines.

The tag is: *misp-galaxy:dwva="Deep Web"*

Cryptocurrencies User

(User of) Decentralized virtual currency that employs cryptography to accomplish tamper-resistance.

The tag is: *misp-galaxy:dwva="Cryptocurrencies User"*

Flash loan attack

An attack to a DeFi protocol that exploits vulnerabilities in the flash loan system

The tag is: *misp-galaxy:dwva="Flash loan attack"*

Privacy coin

Privacy coins are a class of cryptocurrencies that power private and anonymous blockchain transactions by obscuring their origin and destination. Some of the techniques used include hiding a user's real wallet balance and address, and mixing multiple transactions with each other to elude chain analysis.

The tag is: *misp-galaxy:dwva="Privacy coin"*

Peer-to-peer exchange

The exchange or sharing of information, data, or assets between parties without the involvement of a central authority. Peer-to-peer, or P2P, takes a decentralized approach to interactions between individuals and groups. This approach has been used in computers and networking (peer-to-peer file sharing), as well as with virtual assets trading.

The tag is: *misp-galaxy:dwva="Peer-to-peer exchange"*

Proxy

A virtual service that changes users' IP addresses when using the Internet.

The tag is: *misp-galaxy:dwva="Proxy"*

Scam

Scam denotes a fraudulent or deceptive act or operation.

The tag is: *misp-galaxy:dwva="Scam"*

Table 2111. Table References

Links
https://www.merriam-webster.com/dictionary/scam

Sextortion

Sextortion refers to the broad category of sexual exploitation in which abuse of power is the means of coercion, as well as to the category of sexual exploitation in which threatened release of sexual images or information is the means of coercion.

The tag is: *misp-galaxy:dwva="Sextortion"*

Table 2112. Table References

Links

Anubis (Android)

BleepingComputer found that Anubis will display fake phishing login forms when users open up apps for targeted platforms to steal credentials. This overlay screen will be shown over the real app's login screen to make victims think it's a legitimate login form when in reality, inputted credentials are sent to the attackers.

In the new version spotted by Lookout, Anubis now targets 394 apps and has the following capabilities:

Recording screen activity and sound from the microphone Implementing a SOCKS5 proxy for covert communication and package delivery Capturing screenshots Sending mass SMS messages from the device to specified recipients Retrieving contacts stored on the device Sending, reading, deleting, and blocking notifications for SMS messages received by the device Scanning the device for files of interest to exfiltrate Locking the device screen and displaying a persistent ransom note Submitting USSD code requests to query bank balances Capturing GPS data and pedometer statistics Implementing a keylogger to steal credentials Monitoring active apps to mimic and perform overlay attacks Stopping malicious functionality and removing the malware from the device

AxBanker

According to EnigmaSoft, AxBanker is a banking Trojan targeting Android devices specifically. The threatening tool has been deployed as part of large attack campaigns against users in India. The threat actors use smishing (SMS phishing) techniques to smuggle the malware threat onto the victims' devices. The fake applications carrying AxBanker are designed to visually impersonate the official applications of popular Indian banking organizations. The weaponized applications use fake promises or rewards and discounts as additional lures.

BTMOB RAT

According to Cyble, this is an advanced Android malware evolved from SpySolr that features remote control, credential theft, and data exfiltration. It spreads via phishing sites impersonating streaming services like iNat TV and fake mining platforms. The malware abuses Android's Accessibility Service to unlock devices, log keystrokes, and automate credential theft through injections. It uses WebSocket-based C&C communication for real-time command execution and data theft. BTMOB RAT supports various malicious actions, including live screen sharing, file management, audio recording, and web injections.

Catelites

Catelites Bot (identified by Avast and SfyLabs in December 2017) is an Android trojan, with ties to CronBot. Once the malicious app is installed, attackers use social engineering tricks and window overlays to get credit card details from the victim. The distribution vector seems to be fake apps from third-party app stores (not Google Play) or via malvertisement. After installation and activation, the app creates fake Gmail, Google Play and Chrome icons. Furthermore, the malware sends a fake system notification, telling the victim that they need to re-authenticate with Google Services and ask for their credit card details to be entered. Currently the malware has overlays for over 2,200 apps of banks and financial institutions.

CryCryptor

According to NHS Digital, CryCryptor is distributed via websites that spoof health organisations. At the time of publication these websites have affected the Canadian health service. CryCryptor cannot be obtained from the Google Play store, so devices restricted to only running apps from the store are not affected.

When CryCryptor is run it encrypts common file types and saves a ransom note to every directory where files have been encrypted. Encrypted files have the extension '.enc' appended to the filenames. Additional files are saved containing the salt values used in each encryption and an initialisation vector. These files have the extensions '.enc.salt' and '.enc.iv' respectively.

When files have been encrypted, a notification is displayed directing users to open the ransom note.

DroidBot

According to Cleafy, DroidBot is a modern RAT that combines hidden VNC and overlay attack techniques with spyware-like capabilities, such as keylogging and user interface monitoring. Moreover, it leverages dual-channel communication, transmitting outbound data through MQTT and receiving inbound commands via HTTPS, providing enhanced operation flexibility and resilience.

DroidLock

According to Zimperium, DroidLock has the ability to lock device screens with a ransomware-like overlay and illegally acquire app lock credentials, leading to a total takeover of the compromised device.

It employs deceptive system update screens to trick victims and can stream and remotely control devices via VNC. The malware also exploits device administrator privileges to lock or erase data, capture the victim's image with the front camera, and silence the device. Overall, it utilizes 15 distinct commands to interact with its C2 panel.

EagleMsgSpy

According to Lookout, EagleMsgSpy is a lawful intercept surveillance tool developed by a Chinese software development company with use by public security bureaus in mainland China. Early samples indicate the surveillance tool has been operational since at least 2017, with development continued into late 2024. EagleMsgSpy collects extensive data from the user: third-party chat messages, screen recording and screenshot capture, audio recordings, call logs, device contacts, SMS messages, location data, network activity. Through infrastructure overlap and artifacts from open command and control directories, Lookout attributes EagleMsgSpy to Wuhan Chinasoft Token Information Technology Co., Ltd. with high confidence.

FluHorse

According to Check Point, this malware features several malicious Android applications that mimic legitimate applications, most of which have more than 1,000,000 installs. These malicious apps steal the victims' credentials and Two-Factor Authentication (2FA) codes. FluHorse targets different sectors of Eastern Asian markets and is distributed via emails. In some cases, the emails used in the first stage of the attacks belong to high-profile entities. The malware can remain undetected for months making it a persistent, dangerous, and hard-to-spot threat.

FurBall

According to Check Point, they uncovered an operation dubbed "Domestic Kitten", which uses malicious Android applications to steal sensitive personal information from its victims: screenshots, messages, call logs, surrounding voice recordings, and more. This operation managed to remain under the radar for a long time, as the associated files were not attributed to a known malware family and were only detected by a handful of security vendors.

Gaganode (Android)

According to Synthient, Gaganode is a decentralized bandwidth monetization service that enables both users and publishers to earn crypto for their bandwidth or monetize other people's bandwidth. The SDK intentionally implements RCE, thus aligning Gaganode more closely with malware than standard commercial SDKs.

Ginp

Ginp is a mobile banking software targeting Android devices that was discovered by Kaspersky. The malware is able to steal both user credentials and credit cards numbers by implementing overlay attacks. For this, overlay targets are for example the default SMS application. What makes Ginp a remarkable family is how its operators managed to have it remain undetected over time even and it receiving version upgrades over many years. According to ThreatFabric, Ginp has the following features:

Overlaying: Dynamic (local overlays obtained from the C2) SMS harvesting: SMS listing SMS

harvesting: SMS forwarding Contact list collection Application listing Overlaying: Targets list update SMS: Sending Calls: Call forwarding C2 Resilience: Auxiliary C2 list Self-protection: Hiding the App icon Self-protection: Preventing removal Self-protection: Emulation-detection.

Gustuff

Group-IB describes Gustuff as a mobile Android Trojan, which includes potential targets of customers in leading international banks, users of cryptocurrency services, popular ecommerce websites and marketplaces. Gustuff has previously never been reported. Gustuff is a new generation of malware complete with fully automated features designed to steal both fiat and crypto currency from user accounts en masse. The Trojan uses the Accessibility Service, intended to assist people with disabilities. The analysis of Gustuff sample revealed that the Trojan is equipped with web fakes designed to potentially target users of Android apps of top international banks including Bank of America, Bank of Scotland, J.P.Morgan, Wells Fargo, Capital One, TD Bank, PNC Bank, and crypto services such as Bitcoin Wallet, BitPay, Cryptopay, Coinbase etc. Group-IB specialists discovered that Gustuff could potentially target users of more than 100 banking apps, including 27 in the US, 16 in Poland, 10 in Australia, 9 in Germany, and 8 in India and users of 32 cryptocurrency apps.

KoSpy

According to Lookout, this spyware was first observed in March 2022 and remains active with new samples still publicly hosted. It uses a two-stage C2 infrastructure that retrieves initial configurations from a Firebase cloud database. KoSpy can collect extensive data, such as SMS messages, call logs, location, files, audio, and screenshots via dynamically loaded plugins. The spyware has Korean language support with samples distributed across Google Play and third-party app stores such as Apkpure.

PlainGnome

According to Lookout, PlainGnome consists of a two-stage deployment in which a very minimal first stage drops a malicious APK once it's installed. The code of PlainGnome's second stage payload evolved significantly from January 2024 through at least October. In particular, PlainGnome's developers shifted to using Jetpack WorkManager classes to handle data exfiltration, which eases development and maintenance of related code. In addition, WorkManager allows for specifying execution conditions. For example, PlainGnome only exfiltrates data from victim devices when the device enters an idle state. This mechanism is probably intended to reduce the chance of a victim noticing the presence of PlainGnome on their device. As opposed to the minimalist first (installer) stage, the second stage carries out all surveillance functionality and relies on 38 permissions.

RedAlert2

RedAlert 2 is an new Android malware used by an attacker to gain access to login credentials of various e-banking apps. The malware works by overlaying a login screen with a fake display that sends the credentials to a C2 server. The malware also has the ability to block incoming calls from banks, to prevent the victim of being notified. As a distribution vector RedAlert 2 uses third-party app stores and imitates real Android apps like Viber, Whatsapp or fake Adobe Flash Player updates.

Sturnus

According to ThreatFabric, Sturnus is a privately operated Android banking trojan. This malware supports a broad range of fraud-related capabilities, including full device takeover. A key differentiator is its ability to bypass encrypted messaging. By capturing content directly from the device screen after decryption, Sturnus can monitor communications via WhatsApp, Telegram, and Signal.

The trojan can harvest banking credentials through convincing fake login screens that replicate legitimate banking apps. In addition, it provides attackers with extensive remote control, enabling them to observe all user activity, inject text without physical interaction, and even black out the device screen while executing fraudulent transactions in the background—without the victim's knowledge.

TgToxic

According to Trend Micro, TgToxic has been used in an ongoing campaign that has been targeting Android users in Southeast Asia since July 2022. Goal of the campaign is to steal victims' assets from finance and banking applications (such as cryptocurrency wallets, credentials for official bank apps

on mobile, and money in deposit), via a banking trojan they named TgToxic (based on its special encrypted filename) embedded in multiple fake apps. While previously targeting users in Taiwan, Trend Micro observed the fraudulent activities and phishing lures targeting users from Thailand and Indonesia as of this writing. Users are advised to be wary of opening embedded links from unknown email and message senders, and to avoid downloading apps from third party platforms.

Triada

Triada is a remote access trojan (RAT) malware that is used to compromise Android devices in order to steal confidential and sensitive information such as credit card numbers, passwords, bank account information, etc. It also provides a backdoor for attackers to include the device as part of a botnet and perform other malicious activities.

The tag is: *misp-galaxy:malpedia="Triada"*

Triada is also known as:

TrickMo

TrickMo is an advanced banking trojan for Android. Starting out as a companion malware to TrickBot in 2020, it first became a standalone banking trojan by addition of overlay attacks in 2021 and was later (2024) upgraded with remote control capabilities for on-device fraud. The continued development and progressively improved obfuscation suggests an active Threat Actor.

The tag is: *misp-galaxy:malpedia="TrickMo"*

Triout

Bitdefender described Triout as a Android spyware, which appears to act as a framework for building extensive surveillance capabilities into seemingly benign applications. Found bundled with a repackaged app, the spyware's surveillance capabilities involve hiding its presence on the device, recording phone calls, logging incoming text messages, recoding videos, taking pictures and collecting GPS coordinates, then broadcasting all of that to an attacker-controlled C&C (command and control) server.

The tag is: *misp-galaxy:malpedia="Triout"*

Triout is also known as:

TsarBot

According to Cyble, this is a banking trojan that targets over 750 applications globally, including banking, finance, cryptocurrency, and e-commerce apps. The malware spreads via phishing sites masquerading as legitimate financial platforms and is installed through a dropper disguised as Google Play Services. It uses overlay attacks to steal banking credentials, credit card details, and login credentials by displaying fake login pages over legitimate apps. TsarBot can record and remotely control the screen, executing fraud by simulating user actions such as swiping, tapping, and entering credentials while hiding malicious activities using a black overlay screen. It captures device lock credentials using a fake lock screen to gain full control. TsarBot communicates with its C&C server using WebSocket across multiple ports to receive commands, send stolen data, and dynamically execute on-device fraud.

TwoFace

According to Unit42, TwoFace is a two-staged (loader+payload) webshell, written in C# and meant to run on webservers with ASP.NET. The author of the initial loader webshell included legitimate and expected content that will be displayed if a visitor accesses the shell in a browser, likely to remain undetected. The code in the loader webshell includes obfuscated variable names and the embedded payload is encoded and encrypted. To interact with the loader webshell, the threat actor uses HTTP POST requests to the compromised server.

The secondary webshell, which we call the payload, is embedded within the loader in encrypted form and contains additional functionality that we will discuss in further detail. When the threat actor wants to interact with the remote server, they provide data that the loader will use to modify a decryption key embedded within the loader that will be in turn used to decrypt the embedded TwoFace payload. Commands supported by the payload are execution of programs, up-, download and deletion of files and capability to manipulate MAC timestamps.

The tag is: *misp-galaxy:malpedia="TwoFace"*

TwoFace is also known as:

- HighShell
- HyperShell
- Minion
- SEASHARPEE

AVrecon

AVrecon is a Linux-based Remote Access Trojan (RAT) targeting small-office/home-office (SOHO) routers and other ARM-embedded devices. The malware is distributed via exploitation of unpatched vulnerabilities or common misconfiguration of the targeted devices. Once deployed, AVreckon will collect some information about the infected device, open a session to pre-configured C&C server, and spawn a remote shell for command execution. It might also download additional arbitrary files and run them. The malware has recently been used in campaigns aimed at ad-fraud activities, password spraying and data exfiltration.

The tag is: *misp-galaxy:malpedia="AVrecon"*

BiBi-Linux

According to Security Joes, this malware is an x64 ELF executable, lacking obfuscation or protective measures. It allows attackers to specify target folders and can potentially destroy an entire operating system if run with root permissions. During execution, it produces extensive output, which can be mitigated using the "nohup" command. It also leverages multiple threads and a queue to corrupt files concurrently, enhancing its speed and reach. Its actions include overwriting files, renaming them with a random string containing "BiBi," and excluding certain file types from corruption.

The tag is: *misp-galaxy:malpedia="BiBi-Linux"*

BlackCat (ELF)

ALPHV, also known as BlackCat or Noberus, is a ransomware family that is deployed as part of Ransomware as a Service (RaaS) operations. ALPHV is written in the Rust programming language and supports execution on Windows, Linux-based operating systems (Debian, Ubuntu, ReadyNAS, Synology), and VMWare ESXi. ALPHV is marketed as ALPHV on cybercrime forums, but is commonly called BlackCat by security researchers due to an icon of a black cat appearing on its leak site. ALPHV has been observed being deployed in ransomware attacks since November 18, 2021.

ALPHV can be configured to encrypt files using either the AES or ChaCha20 algorithms. In order to maximize the amount of ransomed data, ALPHV can delete volume shadow copies, stop processes and services, and stop virtual machines on ESXi servers. ALPHV can self-propagate by using PsExec

to remote execute itself on other hosts on the local network.

The tag is: *misp-galaxy:malpedia="BlackCat (ELF)"*

BlackCat (ELF) is also known as:

- ALPHV
- Noberus

Chisel (ELF)

Chisel is an open-source project by Jaime Pillora (jpillora) that allows tunneling TCP and UDP connections via HTTP. It is available across platforms and written in Go. While benign in itself, Chisel has been utilized by multiple threat actors. It was for example observed by SentinelOne during a PYSA ransomware campaign to achieve persistence and used as backdoor. Github: https://github.com/jpillora/chisel

CMS8000 Backdoor

According to CISA, this is an implant found in firmware for the Contec CMS8000, a patient monitor used by the Healthcare and Public Health sector. An embedded backdoor function with a hard-coded IP address and functionality that enables patient data spillage was identified.

The tag is: *misp-galaxy:malpedia="CMS8000 Backdoor"*

CMS8000 Backdoor is also known as:

CyclopsBlink

According to CISA, Cyclops Blink appears to be a replacement framework for the VPNFilter malware exposed in 2018, and which exploited network devices, primarily small office/home office (SOHO) routers and network attached storage (NAS) devices. Cyclops Blink has been deployed since at least June 2019, fourteen months after VPNFilter was disrupted. In common with VPNFilter, Cyclops Blink deployment also appears indiscriminate and widespread. The actor has so far primarily deployed Cyclops Blink to WatchGuard and ASUS devices, but it is likely that Sandworm would be capable of compiling the malware for other architectures and firmware.

The tag is: *misp-galaxy:malpedia="CyclopsBlink"*

CyclopsBlink is also known as:

Dacls (ELF)

According to PCrisk, Dacls is the name of a remote access Trojan (RAT), a malicious program that allows cyber criminals to control infected computers remotely.

Research shows that this malware is tied to Lazarus Group (a group of cyber criminals) and targets Linux and the Windows Operating System. Typically, cyber criminals use RATs to steal sensitive, confidential information, infect systems with other malware, and so on. In any case, no RAT is harmless and should be uninstalled immediately.

The tag is: *misp-galaxy:malpedia="Dacls (ELF)"*

Dacls (ELF) is also known as:

Ebury

This payload has been used to compromise kernel.org back in August of 2011 and has hit cPanel

Support which in turn, has infected quite a few cPanel servers. It is a credential stealing payload which steals SSH keys, passwords, and potentially other credentials.

This family is part of a wider range of tools which are described in detail in the operation windigo whitepaper by ESET.

The tag is: *misp-galaxy:malpedia="Ebury"*

Ebury is also known as:

Echobot

The latest in this long line of Mirai scourges is a new variant named Echobot. Coming to life in mid-May, the malware was first described by Palo Alto Networks in a report published at the start of June, and then again in a report by security researchers from Akamai, in mid-June.

When it was first spotted by Palo Alto Networks researchers in early June, Echobot was using exploits for 18 vulnerabilities. In the Akamai report, a week later, Echobot was at 26.

EdgeStepper

According to ESET Research, EdgeStepper is an adversary-in-the-middle tool, which forwards DNS traffic from machines in a targeted network to a malicious DNS node. This allows the attackers to redirect the traffic from software updates to a hijacking node that serves instructions to the legitimate software to download a malicious update.

The tag is: *misp-galaxy:malpedia="EdgeStepper"*

EnemyBot

According to the Infosec Institute, EnemyBot is a dangerous IoT botnet that has made headlines in the last few weeks. This threat, which seems to be disseminated by the Keksec group, expanded its features by adding recent vulnerabilities discovered in 2022. It was designed to attack web servers, Android devices and content management systems (CMS) servers.

HinataBot

HinataBot is a Go-based DDoS-focused botnet. It was observed in the first quarter of 2023 targeting HTTP and SSH endpoints leveraging old vulnerabilities and weak credentials. Amongst those infection vectors are exploitation of the miniigd SOAP service on Realtek SDK devices (CVE-2014-8361), Huawei HG532 routers (CVE-2017-17215), and exposed Hadoop YARN servers.

Horse Shell

Checkpoint Research describes this as part of a custom firmware image affiliated with the Chinese state-sponsored actor “Camaro Dragon”, a custom MIPS32 ELF implant. HorseShell, the main implant inserted into the modified firmware by the attackers, provides the attacker with 3 main functionalities: * Remote shell: Execution of arbitrary shell commands on the infected router * File transfer: Upload and download files to and from the infected router. * SOCKS tunneling: Relay communication between different clients.

J-Magic

According to Lumen, J-Magic is a variant of cd00r and passively scans for five different predefined parameters before activating. If any of these parameters or “magic packets” are received, the agent sends back a secondary challenge. Once that challenge is complete, J-magic establishes a reverse shell on the local file system, allowing the operators to control the device, steal data, or deploy malicious software.

LiquorBot

BitDefender tracked the development of a Mirai-inspired botnet, dubbed LiquorBot, which seems to be actively in development and has recently incorporated Monero cryptocurrency mining features. Interestingly, LiquorBot is written in Go (also known as Golang), which offers some programming advantages over traditional C-style code, such as memory safety, garbage collection, structural typing, and even CSP-style concurrency.

The tag is: *misp-galaxy:malpedia="LiquorBot"*

LiquorBot is also known as:

LittleDaemon

According to ESET Research, LittleDaemon is the first stage deployed on the victim's machine through hijacked updates. It was observed in both DLL and executable versions, both of them 32-bit PEs. The main purpose of LittleDaemon is to communicate with the hijacking node to obtain the

downloader that we call DaemonicLogistics. LittleDaemon does not establish persistence.

Mirai (ELF)

Mirai is one of the first significant botnets targeting exposed networking devices running Linux. Found in August 2016 by MalwareMustDie, its name means "future" in Japanese. Nowadays it targets a wide range of networked embedded devices such as IP cameras, home routers (many vendors involved), and other IoT devices. Since the source code was published on "Hack Forums" many variants of the Mirai family appeared, infecting mostly home networks all around the world.

The tag is: *misp-galaxy:malpedia="Mirai (ELF)"*

Mirai (ELF) is also known as:

- Katana

MrBlack

MrBlack, first identified in May 2014 by Russian security firm Dr. Web, is a botnet that targets Linux OS and is designed to conduct distributed denial-of-service (DDoS) attacks. In May 2015, Incapsula clients suffered a large-scale DDoS attack which the company attributed to network traffic generated by tens of thousands of small office/home office (SOHO) routers infected with MrBlack. This massive botnet spans over 109 countries, especially in Thailand and Brazil.

MrBlack scans for and infects routers that have not had their default login credentials changed and that allow remote access to HTTP and SSH via port 80 and port 22, respectively. One of the most impacted router brands is Ubiquiti, a U.S.-based firm that provides bulk network hub solutions for

internet service providers to lease to their customers. Once a vulnerable router is compromised and MrBlack is injected into the system, a remote server is contacted and system information from the device is transmitted. This allows the host server to receive commands in order to perform different types of DDoS attacks, download and execute files, and terminate processes.

The tag is: *misp-galaxy:malpedia="MrBlack"*

MrBlack is also known as:

- AESDDoS
- Dofloo

Nosedive

According to Black Lotus Labs, Nosedive is a custom variation of the Mirai implant that is supported on all major SOHO and IoT architectures (e.g. MIPS, ARM, SuperH, PowerPC, etc.). Nosedive implants are typically deployed from Tier 2 payload servers in the Raptor Train infrastructure through a unique URL encoding scheme and domain injection method. Nosedive

droppers use this method to request payloads for specific C2s by encoding the requested C2 domain and joining it with a unique "key" that identifies the bot and the target architecture of the compromised device (e.g. MIPS, ARM, etc.), which is then injected into the Nosedive implant payload that is deployed to the Tier 1 node. Once deployed, Nosedive runs in-memory only and allows the operators to execute commands, upload and download files, and run DDoS attacks on compromised devices.

The malware and its associated droppers are memory-resident only and deleted from disk. This, in addition to anti-forensics techniques employed on these devices including the obfuscation of running process names, compromising devices through a multi-stage infection chain, and killing remote management processes, makes detection and forensics much more difficult.

The tag is: *misp-galaxy:malpedia="Nosedive"*

Nosedive is also known as:

NOTROBIN

FireEye states that NOTROBIN is a utility written in Go 1.10 and compiled to a 64-bit ELF binary for BSD systems. It periodically scans for and deletes files matching filename patterns and content characteristics. The purpose seems to be to block exploitation attempts against the CVE-2019-19781 vulnerability; however, FireEye believes that NOTROBIN provides backdoor access to the compromised system.

The tag is: *misp-galaxy:malpedia="NOTROBIN"*

PolarEdge

According to Sekoia, this is a form of TLS backdoor containing pre-defined commands. Their investigation initially identified Cisco routers as a target but they also uncovered other payloads from the same family, but targeting different devices, notably Asus, QNAP and Synology. A working hypothesis suggests that devices compromised with PolarEdge could be used as Operational Relay Boxes (ORB) to facilitate offensive cyber operations.

PUMAKIT

According to Elastic, PUMAKIT is a sophisticated loadable kernel module (LKM) rootkit that employs advanced stealth mechanisms to hide its presence and maintain communication with command-and-control servers.

The rootkit component, referenced by the malware authors as “PUMA", employs an internal Linux function tracer (ftrace) to hook 18 different syscalls and several kernel functions, enabling it to manipulate core system behaviors. Unique methods are used to interact with PUMA, including using the rmdir() syscall for privilege escalation and specialized commands for extracting configuration and runtime information.

Key functionalities of the kernel module include privilege escalation, hiding files and directories, concealing itself from system tools, anti-debugging measures, and establishing communication with command-and-control (C2) servers.

There is also an accompanying userland SO rootkit internally referred to as Kitsune.

The tag is: *misp-galaxy:malpedia="PUMAKIT"*

PUMAKIT is also known as:

pupy (ELF)

Pupy is an open-source, cross-platform RAT and post-exploitation framework mainly written in python. Pupy can be loaded from various loaders, including PE EXE, reflective DLL, Linux ELF, pure python, powershell and APK. Most of the loaders bundle an embedded python runtime, python library modules in source/compiled/native forms as well as a flexible configuration. They bootstrap a python runtime environment mostly in-memory for the later stages of pupy to run in. Pupy can communicate using various transports, migrate into processes, load remote python code, python packages and python C-extensions from memory.

The tag is: *misp-galaxy:malpedia="pupy (ELF)"*

pupy (ELF) is also known as:

Qilin

Qilin ransomware, initially observed in July 2022 under the name “Agenda,” operates on a Ransomware-as-a-Service (RaaS) model. This model allows core developers to provide their malicious software and infrastructure to affiliates in exchange for a percentage of the profits generated from attacks. The name “Qilin” references a Chinese mythological creature symbolizing power and prosperity, a fitting metaphor for the group’s perceived influence and financial objectives. Despite the Chinese name, the group is linked to Russian-speaking cybercriminals, often recruiting affiliates on Russian-language forums and notably excluding Commonwealth of Independent States (CIS) countries from its targets.

The tag is: *misp-galaxy:malpedia="Qilin"*

Qilin is also known as:

QNAPCrypt

The QNAPCrypt ransomware works similarly to other ransomware, including encrypting all files and delivering a ransom note. However, there are several important differences:

1. The ransom note was included solely as a text file, without any message on the screen—naturally, because it is a server and not an endpoint.
2. Every victim is provided with a different, unique Bitcoin wallet—this could help the attackers avoid being traced.
3. Once a victim is compromised, the malware requests a wallet address and a public RSA key from the command and control server (C&C) before file encryption.

The tag is: *misp-galaxy:malpedia="QNAPCrypt"*

QNAPCrypt is also known as:

- eCh0raix

Roboto

P2P Botnet discovered by Netlab360. The botnet infects linux servers via the Webmin RCE vulnerability (CVE-2019-15107) which allows attackers to run malicious code with root privileges and take over older Webmin versions. Based on the Netlabs360 analysis, the botnet serves mainly 7 functions: reverse shell, self-uninstall, gather process' network information, gather Bot information, execute system commands, run encrypted files specified in URLs and four DDoS attack methods: ICMP Flood, HTTP Flood, TCP Flood, and UDP Flood.

RotaJakiro

RotaJakiro is a stealthy Linux backdoor which remained undetected between 2018 and 2021. The malware uses rotating encryption to encrypt the resource information within the sample, and C2 communication, using a combination of AES, XOR, ROTATE encryption and ZLIB compression.

The tag is: *misp-galaxy:malpedia="RotaJakiro"*

SALTWATER

According to Mandiant, SALTWATER is a module for the Barracuda SMTP daemon (bsmtpd) that has backdoor functionality. SALTWATER can upload or download arbitrary files, execute commands, and has proxy and tunneling capabilities. The backdoor is implemented using hooks on the send, recv, close syscalls via the 3rd party kubo/funchook hooking library, and amounts to five components, most of which are referred to as "Channels" within the binary. In addition to providing backdoor and proxying capabilities, these components exhibit classic backdoor functionality.

SEASPY

According to CISA, this malware is a persistent backdoor that masquerades as a legitimate Barracuda Networks service. The malware is designed to listen to commands received from the Threat Actor's Command-and-Control through TCP packets. When executed, the malware uses libpcap sniffer to monitor traffic for a magic packet on TCP port 25 (SMTP) and TCP port 587. It checks the network packet captured for a hard-coded string. When the right sequence of packet is captured, it establishes a TCP reverse shell to the C2 server for further exploitation. This allows the TA to execute arbitrary commands on the compromised system. The malware is based on an open-source backdoor program named "cd00r".

SimpleTea (ELF)

SimpleTea for Linux is an HTTP(S) RAT.

It was discovered in Q1 2023 as an instance of the Lazarus group's Operation DreamJob campaign for Linux. It was a payload downloaded in an execution chain which started with an HSBC-themed job offer lure. It shared the same C&C server as payloads from the 3CX incident around the same time.

It's an object-oriented project, which does not run on Linux distributions without a graphical user interface, and decrypts its configuration from /home/%user%/.config/apdl.cf using 0x7E as the XOR key. It uses AES-GCM for encryption and decryption of its network traffic.

It supports basic commands that include operations on the victim's filesystem, manipulation with its configuration, file exfiltration (via ZIP archives), and the download and execution of additional tools from the attacker's arsenal. The commands are indexed by 16-bit integers, starting with the value 0x27C3.

SimpleTea for Linux seems like an updated version of BadCall for Linux, rewritten from C to C++, as there are similarities in class names and function names between the two.

The tag is: *misp-galaxy:malpedia="SimpleTea (ELF)"*

SimpleTea (ELF) is also known as:

- PondRAT
- SimplexTea

sustes miner

Sustes Malware doesn’t infect victims by itself (it’s not a worm) but it is spread over exploitation and brute-force activities with special focus on IoT and Linux servers. The initial infection stage comes from a custom wget directly on the victim machine followed by a simple /bin/bash mr.sh. The script is a simple bash script which drops and executes additional software.

Unidentified Linux 001

According to Cybereason, these scripts have been used in an ongoing campaign exploiting a widespread vulnerability in the Exim MTA: CVE-2019-10149. This attack leverages a week-old vulnerability to gain remote command execution on the target machine, search the Internet for other machines to infect, and initiates a crypto miner.

WatchBog

According to Intezer, this is a spreader module used by WatchBog. It is a dynamically linked ELF executable, compiled with Cython. C&C adresses are fetched from Pastebin. C&C communication references unique identification keys per victim. It contains a BlueKeep scanner, reporting positively scanned hosts to the C&C server (RC4 encrypted within SSL/TLS). It contains 5 exploits targeting Jira, Exim, Solr, Jenkins and Nexus Repository Manager 3.

xmrig

According to PCrisk, XMRIG is a completely legitimate open-source application that utilizes system CPUs to mine Monero cryptocurrency. Unfortunately, criminals generate revenue by infiltrating this app into systems without users' consent. This deceptive marketing method is called "bundling".

In most cases, "bundling" is used to infiltrate several potentially unwanted programs (PUAs) at once. So, there is a high probability that XMRIG Virus came with a number of adware-type applications that deliver intrusive ads and gather sensitive information.

The tag is: *misp-galaxy:malpedia="xmrig"*

VALIDVICTOR

According to Google, this reconnaissance payload uses a profiling framework drawing canvas to identify the target's exact iPhone model, a technique used by many other actors. The iPhone model is sent back to the C2 along with screen size, whether or not a touch screen is present, and a unique identifier per initial GET request (e.g., 1lwuzddaxoom5ylli37v90kj). The server replies with either an AES encrypted next stage or 0, indicating that no payload is available for this device. The payload makes another request to the exploit server with gcr=1 as a parameter to get the AES decryption key from the C2.

AdWind

Part of Malware-as-service platform Used as a generic name for Java-based RAT Functionality - collect general system and user information - terminate process -log keystroke -take screenshot and access webcam - steal cache password from local or web forms - download and execute Malware - modify registry - download components - Denial of Service attacks - Acquire VPN certificates

Initial infection vector 1. Email to JAR files attached 2. Malspam URL to downlaod the malware

Persistence - Runkey - HKCU\Software\Microsoft\Windows\current version\run

Hiding Uses attrib.exe

Notes on Adwind The malware is not known to be proxy aware

The tag is: *misp-galaxy:malpedia="AdWind"*

AdWind is also known as:

- AlienSpy
- Frutas
- JBifrost
- JSocket
- Sockrat
- UNRECOM

Akemi

According to VMRay, this malware family uses in interesting obfuscation technique: a trailing slash in its archive to confuse analysis tools. It abuses #GitHub as a #C2 and exfiltrates stolen data, such as browser cookies, via Discord webhooks. The GitHub repositories are quite active and exist since mid to late 2024. The malware also monitors keyboard and mouse input, takes screenshots.

DynamicRAT

DynamicRAT is a malware that is spread via email attachments and compromises the security of computer systems. Once running on a device, DynamicRAT establishes a persistent presence and gives attackers complete remote control. Its features include sensitive data exfiltration, hardware control, remote action, and the ability to perform DDoS attacks. In addition, DynamicRAT uses evasion and persistence techniques to evade detection and analysis by security solutions.

The tag is: *misp-galaxy:malpedia="DynamicRAT"*

DynamicRAT is also known as:

- DYNARAT

EpicSplit RAT

EpicSplit RAT is a multiplatform Java RAT that is capable of running shell commands, downloading, uploading, and executing files, manipulating the file system, establishing persistence, taking screenshots, and manipulating keyboard and mouse events. EpicSplit is typically obfuscated with the commercial Allatori Obfuscator software. One unique feature of the malware is that TCP messages sent by EpicSplit RAT to its C2 are terminated with the string "*packet*" as a packet delimiter.

JavaDispCash

JavaDispCash is a piece of malware designed for ATMs. The compromise happens by using the JVM attach-API on the ATM's local application and the goal is to remotely control its operation. The malware's primary feature is the ability to dispense cash. The malware also spawns a local port (65413) listening for commands from the attacker which needs to be located in the same internal network.

The tag is: *misp-galaxy:malpedia="JavaDispCash"*

JavaDispCash is also known as:

jRAT

jRAT, also known as Jacksbot, is a RAT with history, written in Java. It has support for macOS, Linux, Windows and various BSD. It also has functionality to participate in DDoS-attacks as well as to perform click fraud. Note that the Adwind family often is mistakenly labeled as jRAT, because of of a red hering reference to jrat.io.

Qarallax RAT

According to SpiderLabs, in May 2015 the "company" Quaverse offered a RAT known as Quaverse RAT or QRAT. At around May 2016, this QRAT evolved into another RAT which became known as Qarallax RAT, because its C2 is at qarallax.com. Quaverse also offers a service to encrypt Java payloads (Qrypter), and thus qrypted payloads are sometimes confused with Quaverse RATs (QRAT / Qarallax RAT).

Sorillus RAT

Sorillus is a Java-based multifunctional remote access trojan (RAT) that targets Linux, macOS, and

Windows operating systems. First created in 2019, the tool gained significant attention in 2022 when various obfuscated client versions began appearing on VirusTotal starting January 18, 2022. The RAT's features were detailed on its now-defunct website (hxxps://sorillus[.]com), where it was marketed for lifetime access at 59.99€, with a discounted price of 19.99€ at the time. Payments were conveniently accepted via various cryptocurrencies.

The creator and distributor of Sorillus, a YouTube user known as "Tapt," claimed the tool could collect sensitive information from infected systems, including:

```
HardwareID
```

```
Username
```

```
Country
```

```
Language
```

```
Webcam footage
```

```
Headless status
```

```
Operating system details
```

```
Client version
```

However, Sorillus was shut down in 2025 following the FBI's Operation "Talent," which targeted alot of the Cracking infrastucture which included Sellix, the payment portal used by Sorillus for transactions. This operation disrupted the financial infrastructure supporting the RAT, leading to its cessation of operations 5 days later.

STRRAT

STRRAT is a Java-based RAT, which makes extensive use of plugins to provide full remote access to an attacker, as well as credential stealing, key logging and additional plugins. The RAT has a focus on stealing credentials of browsers and email clients, and passwords via keylogging. It supports the following browsers and email clients: Firefox, Internet Explorer, Chrome, Foxmail, Outlook, Thunderbird.

Since Version 1.2 and above, STRRAT was infamous for its ransomware-like behavior of appending the file name extension .crimson to files. Version 1.5 is notably more obfuscated and modular than previous versions, but the backdoor functions mostly remain the same: collect browser passwords, run remote commands and PowerShell, log keystrokes, among others. Version 1.5 of STRRAT Malware includes a proper encryption routine, though currently pretty simple to revert.

The tag is: *misp-galaxy:malpedia="STRRAT"*

BeaverTail (Javascript)

BeaverTail is a JavaScript malware primarily distributed through NPM packages. It is designed for information theft and to load further stages of malware, specifically a multi-stage Python-based backdoor known as InvisibleFerret. BeaverTail targets cryptocurrency wallets and credit card information stored in the victim's web browsers. Its code is heavily obfuscated to evade detection. Threat actors can either upload malicious NPM packages containing BeaverTail to GitHub or inject

BeaverTail code into legitimate NPM projects. Researchers have identified additional Windows and macOS variants, indicating that the BeaverTail malware family is likely still under development.

The tag is: *misp-galaxy:malpedia="BeaverTail (Javascript)"*

BELLHOP

- BELLHOP is a JavaScript backdoor interpreted using the native Windows Scripting Host(WSH). After performing some basic host information gathering, the BELLHOP dropper downloads a base64-encoded blob of JavaScript to disk and sets up persistence in three ways:
- Creating a Run key in the Registry
- Creating a RunOnce key in the Registry
- Creating a persistent named scheduled task
- BELLHOP communicates using HTTP and HTTPS with primarily benign sites such as Google Docs and PasteBin.

ContagiousDrop

According to SentinelOne, these applications, typically implemented in app.js files, are deployed on ClickFix malware distribution servers. These applications run servers that listen on configured ports to handle incoming HTTP GET and POST requests, executing different functions based on the specific request path. The ContagiousDrop applications deliver malware disguised as software updates or essential utilities. They distribute a tailored payload based on the victim's operating system (Windows, macOS, or Linux), system architecture, and method of interaction with the server, such as the use of the curl command. In addition to delivering malware, the ContagiousDrop

applications feature an integrated email notification system. These notifications, sent from a configured email address, provide the Contagious Interview threat actors with insights into victim engagement and interaction patterns and are delivered to their configured recipient addresses.

GlassWorm

According to Koi Security, this malware harvests NPM, GitHub, and Git credentials for supply chain propagation. It targets 49 different cryptocurrency wallet extensions to drain funds. It uses stolen credentials to compromise additional packages and extensions, spreading the worm further. Furthermore, it deploys SOCKS proxy servers, turning developer machines into criminal infrastructure and installs hidden VNC servers for complete remote access.

The tag is: *misp-galaxy:malpedia="GlassWorm"*

magecart

Magecart is a malware framework intended to steal credit card information from compromised eCommerce websites. Used in criminal activities, it’s a sophisticated implant built on top of relays, command and controls and anonymizers used to steal eCommerce customers' credit card information. The first stage is typically implemented in Javascript included into a compromised

checkout page. It copies data from "input fields" and send them to a relay which collects credit cards coming from a subset of compromised eCommerces and forwards them to Command and Control servers.

MintsLoader

According to Orange Cyberdefense, MintsLoader is a little-known, multi-stage malware loader that has been used since at least February 2023. It has been observed in widespread distribution campaigns between July and October 2024. The name comes from a very characteristic use of an URL parameter “1.php?s=mintsXX" (with XX being numbers).

MintsLoader primarily delivers malicious RAT or infostealing payloads such as AsyncRAT and Vidar through phishing emails, targeting organizations in Europe (Spain, Italy, Poland, etc.). Written in JavaScript and PowerShell, MintsLoader operates through a multi-step infection process involving several URLs and domains, most of which use a domain generation algorithm (DGA) with .top TLD.

The tag is: *misp-galaxy:malpedia="MintsLoader"*

MintsLoader is also known as:

ostap

Ostap is a commodity JScript downloader first seen in campaigns in 2016. It has been observed being delivered in ACE archives and VBA macro-enabled Microsoft Office documents. Recent versions of Ostap query WMI to check for a blacklist of running processes:

AgentSimulator.exe anti-virus.EXE BehaviorDumper BennyDB.exe ctfmon.exe fakepos_bin FrzState2k gemu-ga.exe (Possible misspelling of Qemu hypervisor's guest agent, qemu-ga.exe) ImmunityDebugger.exe KMS Server Service.exe ProcessHacker procexp Proxifier.exe python tcpdump VBoxService VBoxTray.exe VmRemoteGuest vmtoolsd VMware2B.exe VzService.exe winace Wireshark

If a blacklisted process is found, the malware terminates.

Ostap has been observed delivering other malware families, including Nymaim, Backswap and TrickBot.

The tag is: *misp-galaxy:malpedia="ostap"*

SpyPress

According to ESET, SpyPress is a set of Javascript payloads targeting different webmail frameworks (HORDE, MDAEMON, ROUNDCUBE, ZIMBRA). The observed payloads have common characteristics. All are similarly obfuscated, with variable and function names replaced with random-looking strings. Furthermore, strings used by the code, such as webmail and C&C server URLs, are also obfuscated and contained in an encrypted list. Each of those strings is only decrypted when it is used. Note that the variable and function names are randomized for each sample, so the final SpyPress payloads will have different hashes. Another common characteristic is that there are no persistence or update mechanisms. The payload is fully contained in the email and only executed when the email message is viewed from a vulnerable webmail instance.

Finally, all payloads communicate with their hardcoded C&C servers via HTTP POST requests. There is a small number of C&C servers that are shared by all payloads (there is no separation by victim or payload type).

The tag is: *misp-galaxy:malpedia="SpyPress"*

SpyPress is also known as:

SQLRat

SQLRat campaigns typically involve a lure document that includes an image overlayed by a VB Form trigger. Once a user has double-clicked the embedded image, the form executes a VB setup script. The script writes files to the path %appdata%\Roaming\Microsoft\Templates\, then creates two task entries triggered to run daily. The scripts are responsible for deobfuscating and executing the main JavaScript file mspromo.dot. The file uses a character insertion obfuscation technique, making it appear to contain Chinese characters. After deobfuscating the file, the main JavaScript is easily recognizable. It contains a number of functions designed to drop files and execute scripts on a host system. The SQLRat script is designed to make a direct SQL connection to a Microsoft database controlled by the attackers and execute the contents of various tables.

The tag is: *misp-galaxy:malpedia="SQLRat"*

Valak

According to PCrisk, Valak is malicious software that downloads JScript files and executes them. What happens next depends on the actions performed by the executed JScript files. It is very likely that cyber criminals behind Valak attempt to use this malware to cause chain infections (i.e., using Valak to distribute other malware).

Research shows that Valak is distributed through spam campaigns, however, in some cases, it infiltrates systems when they are already infected with malicious program such as Ursnif (also known as Gozi).

The tag is: *misp-galaxy:malpedia="Valak"*

Valak is also known as:

- Valek

js.wd

The threat actor of this family compromised Chrome extension developer accounts and attached malicious code to the extensions. Web Developer 0.4.9, Chrometana 1.1.3, Infinity New Tab 3.12.3, CopyFish 2.8.5, Web Paint 1.2.1, and Social Fixer 20.1.1 were affected by this. TouchVPN and BetterVPN were assumed to be targets as well.

This lead to the execution of another Javascript that substitutes ad banners for their own, effectively hijacking ad traffic. It is also reported that fake pop-up alerts were used to lure victims to download possibly other malware.

CoinThief

CoinThief was a malware package designed to steal Bitcoins from the victim, consisting of a binary patcher, browser extensions, and a backdoor component.

It was spreading in early 2014 from several different sources: - on Github (where the trojanized compiled binary didn't match the displayed source code), o - on popular and trusted download sites line CNET's Download.com or MacUpdate.com, and - as cracked applications via torrents camouflaged as Bitcoin Ticker TTM, BitVanity, StealthBit, Litecoin Ticker, BBEdit, Pixelmator, Angry Birds and Delicious Library.

The patcher‘s role was to locate and modify legitimate versions of the Bitcoin-Qt wallet application. The analyzed malware samples targeted versions of Bitcoin-Qt 0.8.1, 0.8.0 and 0.8.5. The earlier patch modified Bitcoin-Qt adding malicious code that would send nearly all the victim's Bitcoins to one of the hard-coded addresses belonging to the attacker.

The browser extensions targeted Chrome and Firefox and are disguised as a "Pop-up blocker". The extensions monitored visited websites, download malicious JavaScripts and injected them into various Bitcoin-related websites (mostly Bitcoin exchanges and online wallet sites). The injected JS scripts were able to modify transactions to redirect Bitcoin transfers to an attacker's address or simply harvest login credentials to the targeted online service.

The backdoor enabled the attacker to take full control over the victim's computer: - collect information about the infected computer - execute arbitrary shell scripts on the target computer - upload an arbitrary file from the victim's hard drive to a remote server - update itself to a newer version

Dacls (OS X)

According to PCrisk, Dacls is the name of a remote access Trojan (RAT), a malicious program that allows cyber criminals to control infected computers remotely.

Research shows that this malware is tied to Lazarus Group (a group of cyber criminals) and targets Linux and the Windows Operating System. Typically, cyber criminals use RATs to steal sensitive, confidential information, infect systems with other malware, and so on. In any case, no RAT is harmless and should be uninstalled immediately.

Eleanor

Eleanor comes as a drag-and-drop file utility called EasyDoc Converter. This application bundle wraps a shell script that uses Dropbox name as a disguise and installs three components: a hidden Tor service, a Pastebin agent and a web service with a PHP-based graphical interface.

The Tor service transforms the victim's computer into a server that provides attackers with full anonymous access to the infected machine via Tor-generated address.

The Pastebin agent uploads the address in encrypted form to the Pastebin website where the attackers can obtain it.

The web service is the main malicious component that provides the attackers with the control over the infected machine. After successful authentication, the interface offers several control panels to the attackers, allowing them to do the following actions:

- Managing files
- Listing processes
- Connecting to various database management systems such as MySQL or SQLite
- Connecting via bind/reverse shell
- Executing shell command

- Capturing and browsing images and videos from the victim's webcam
- Sending emails with an attachment

The tag is: *misp-galaxy:malpedia="Eleanor"*

EvilQuest

According to PcRisk, EvilQuest (also known as ThiefQuest) is like many other malicious programs of this type - it encrypts files and creates a ransom message. In most cases, this type of malware modifies the names of encrypted files by appending certain extensions, however, this ransomware leaves them unchanged.

It drops the "READ_ME_NOW.txt" in each folder that contains encrypted data and displays another ransom message in a pop-up window. Additionally, this malware is capable of detecting if certain files are stored on the computer, operates as a keylogger, and receives commands from a Command & Control server.

Patcher

This crypto-ransomware for macOS was caught spreading via BitTorrent distribution sites in February 2017, masquerading as 'Patcher', an application used for pirating popular software like Adobe Premiere Pro or Microsoft Office for Mac.

The downloaded torrent contained an application bundle in the form of a single zip file. After launching the fake application, the main window of the fake cracking tool was displayed.

The file encryption process was launched after the misguided victim clicked 'Start'. Once executed, the ransomware generated a random 25-character string and set it as the key for RC4 encryption of all of the user's files. It then demanded ransom in Bitcoin, as instructed in the 'README!' .txt file copied all over the user's directories.

Despite the instructions being quite thorough, Patcher lacked the functionality to communicate with any C&C server, and therefore made it impossible for its operators to decrypt affected files. The randomly generated encryption key was also too long to be guessed via a brute-force attack, leaving the encrypted data unrecoverable in a reasonable amount of time.

The tag is: *misp-galaxy:malpedia="Patcher"*

Patcher is also known as:

- FileCoder
- Findzip

Proton RAT

Proton RAT is a Remote Access Trojan (RAT) specifically designed for macOS systems. It is known for providing attackers with complete remote control over the infected system, allowing the execution of commands, keystroke capturing, access to the camera and microphone, and the ability to steal credentials stored in browsers and other password managers. This malware typically spreads through malicious or modified applications, which, when downloaded and installed by unsuspecting users, trigger its payload. Proton RAT is notorious for its sophistication and evasion capabilities, including techniques to bypass detection by installed security solutions.

The tag is: *misp-galaxy:malpedia="Proton RAT"*

Proton RAT is also known as:

- Calisto

Dok

Dok a.k.a. Retefe is the macOS version of the banking trojan Retefe. It consists of a codesigned Mach-O dropper usually malspammed in an app bundle within a DMG disk image, posing as a document. The primary purpose of the dropper is to install a Tor client as well as a malicious CA certificate and proxy pac URL, in order to redirect traffic to targeted sites through their Tor node, effectively carrying out a MITM attack against selected web traffic. It also installs a custom hosts file to prevent access to Apple and VirusTotal. The macOS version shares its MO, many TTPs and infrastructure with the Windows counterpart.

The tag is: *misp-galaxy:malpedia="Dok"*

SimpleTea (OS X)

SimpleTea is a RAT for macOS that is based on the same object-oriented project as SimpleTea for Linux (SimplexTea).

It also shares similarities with POOLRAT (also known as SIMPLESEA), like the supported commands or a single-byte XOR encryption of its configuration. However, the indices of commands are different.

SimpleTea for macOS was uploaded to VirusTotal from Hong Kong and China in September 2023.

PS1Bot

According to Cisco Talos, this is multi-stage malware framework, implemented in PowerShell and C#, that possesses robust functionality, including the ability to deliver follow-on modules including an information stealer, keylogger, screen capture collector and more. It also establishes persistence to continue operations following system reboots. The design of this malware framework appears to

attempt to minimize artifacts left on infected systems by facilitating the delivery and execution of modules in-memory, without requiring them to be written to disk. Due to similarities in the design and implementation with the malware family AHK Bot, we are referring to this PowerShell-based malware as “PS1Bot.”

The tag is: *misp-galaxy:malpedia="PS1Bot"*

COOKBOX

According to CERT-UA, COOKBOX is a PowerShell script that implements the functionality of downloading and executing PowerShell cmdlets. For each affected computer, a unique identifier is calculated using cryptographic transformations (SHA256/MD5 hash functions) based on a combination of computer name and disk serial number, which is transmitted in the “X-Cookie” header of HTTP requests when interacting with the management server. The persistence of the backdoor is ensured by the corresponding key in the Run branch of the operating system (OS) registry, which is created at the stage of the initial infection by a third-party PowerShell script

(including the COOKBOX deployer). As a rule, obfuscation elements are used in the program code: chr-character encoding, character replacement (replace()), base64 conversion, GZIP compression.

DarkWisp

According to Trend Micro, DarkWisp is a PowerShell-based backdoor and reconnaissance utility designed for unauthorized system access and intelligence gathering. It enables attackers to exfiltrate sensitive data while maintaining persistent control over the compromised system. The malware collects extensive information about the compromised system to create a detailed profile. It determines whether the user has administrative privileges, checks for membership in a corporate domain, and identifies the presence of cryptocurrency wallets or VPN software by scanning specified directories and applications. It also gathers data about the system's operating environment, including public IP address, geographic location, installed antivirus products, firewall status, and system uptime. This information is compiled into a structured format and transmitted to the C&C server.

GhostWeaver

According to TRAC Labs, the GhostWeaver backdoor not only maintains continuous, authenticated communication with its command-and-control server but also includes functionalities to generate DGA domains (using a fixed-seed algorithm based on the week number and year), deliver additional payloads via remote commands and bypass certificate validation by leveraging a RemoteCertificateValidationCallback that always returns true. Multiple delivered plugins are designed to target sensitive information - including credentials from popular browsers (Brave, Chrome, Firefox, Edge), Outlook data, and cryptocurrency wallets. The Formgrabber plugin includes web injection methods by dynamically manipulating HTML content, modifying JA3 fingerprints via cipher suite reordering, and employing a man-in-the-middle proxy setup to intercept the traffic. GhostWeaver's and plugins' delivery on systems that are not part of an Active Directory domain suggests that attackers are extending their reach beyond typical corporate targets, aligning with a financially motivated agenda that exploits environments with weaker security controls.

HTTP-Shell

The author describes this open source shell as follows. HTTP-Shell is Multiplatform Reverse Shell.

This tool helps you to obtain a shell-like interface on a reverse connection over HTTP. Unlike other reverse shells, the main goal of the tool is to use it in conjunction with Microsoft Dev Tunnels, in order to get a connection as close as possible to a legitimate one.

This shell is not fully interactive, but displays any errors on screen (both Windows and Linux), is capable of uploading and downloading files, has command history, terminal cleanup (even with CTRL+L), automatic reconnection, movement between directories and supports sudo (or sudo su) on Linux-based OS.

PowerHarbor

PowerHarbor is a modular PowerShell-based malware that consists of various modules. The primary module maintains constant communication with the C2 server, executing and deleting additional modules received from it. Currently, the communication with the C2 server is encrypted using RSA encryption and hardcoded key data. Moreover, the main module incorporates virtual machine (VM) detection capabilities. The StealData module employs the Invoke-Stealer function as its core, enabling the theft of system information, browser-stored credentials, cryptocurrency wallet details, and credentials for various applications like Telegram, FileZilla, and WinSCP.

SilentPrism

According to Trend Micro, SilentPrism is a backdoor malware designed to achieve persistence, dynamically execute shell commands, and maintain unauthorized remote control of compromised systems. It implements persistence mechanisms differently based on user privileges: for non-administrative users, it leverages the Windows registry to create auto-run entries using mshta.exe combined with VBScript to download and execute remote payloads; for administrative users, it deploys scheduled tasks with similar execution methods. SilentPrism retrieves additional payloads and instructions from a C&C server, ensuring modular functionality. The malware communicates with its C&C server using encrypted channels, employing AES encryption and Base64 encoding to obfuscate data. Commands received are decrypted and executed in various ways, including direct PowerShell script execution, dynamic script block creation, or job-based execution. Each task is tracked using unique identifiers, allowing the malware to monitor execution states and return results to the server. SilentPrism incorporates anti-analysis techniques such as virtual machine detection and randomized sleep intervals (ranging from 300 to 700 milliseconds) between operations, making its behavior less predictable. Additionally, it continuously polls the C&C server for commands, enabling operators to dynamically control infected systems.

The tag is: *misp-galaxy:malpedia="SilentPrism"*

AndroxGh0st

According to Laceworks, this is a SMTP cracker, which is primarily intended to scan for and parse Laravel application secrets from exposed .env files. Note: Laravel is an open source PHP framework and the Laravel .env file is often targeted for its various configuration data including AWS, SendGrid and Twilio. AndroxGh0st has multiple features to enable SMTP abuse including scanning, exploitation of exposed creds and APIs, and even deployment of webshells. For AWS specifically, the malware scans for and parses AWS keys but also has the ability to generate keys for brute force attacks. However, the brute force capability is likely a novelty and is a statistically unlikely attack vector.

Creal Stealer

Creal is an open-source grabber/credential stealer that was originally made by a GitHub user named Ayhuuu, who even advertised a "premium" version on his now-deleted Telegram channel @Crealstealer. To the day of release, it was already not FUD, but its open-source nature made it attractive for threat actors to modify the base malware and even obfuscate it for less detection ratios. The base project came with a compiler, and the general source code the compiler used was PyInstaller for compilation into native formats like exe. For C2, Discord webhooks were utilized, which in later versions got protected with a service called https://stealer.to to make deletion not possible.

It Compromised following Data on Execution:

- Discord Information

- Browser Data
- Crypto Related Data
- Steam
- Riot Games
- Telegram
- System Information
- Tokens/Secrets

PXA Stealer

PXA Stealer is an information-stealing malware written in Python, identified by Cisco Talos in an active campaign attributed to a Vietnamese-speaking threat actor (2024). The stealer targets sensitive data such as credentials for online accounts, VPN and FTP clients, financial information, browser cookies, and gaming-related data. Notably, PXA Stealer is capable of decrypting browser master passwords to exfiltrate stored credentials. The campaign leverages heavily obfuscated batch scripts for delivery and execution. The actor behind this operation is linked to the Telegram channel “Mua Bán Scan MINI,” known to host credential trade and cybercrime activity. While there are connections to the CoralRaider adversary, attribution to this group remains unconfirmed. In q2 2025 PXA stealer was observed to target Italy.

HALFBAKED

The HALFBAKED malware family consists of multiple components designed to establish and maintain a foothold in victim networks, with the ultimate goal of gaining access to sensitive financial information. HALFBAKED listens for the following commands from the C2 server:

```
info: Sends victim machine information (OS, Processor, BIOS and running processes)
using WMI
        queries
processList: Send list of process running
screenshot: Takes screen shot of victim machine (using 58d2a83f777688.78384945.ps1)
runvbs: Executes a VB script
runexe: Executes EXE file
runps1: Executes PowerShell script
delete: Delete the specified file
update: Update the specified file
```

HATVIBE

According to Sekoia, the aim of this backdoor is to receive VBS modules for execution from a remote C2 server. Once received, HATVIBE uses a simple XOR algorithm to decrypt each module, contact it between two <script> tags before adding it to the HTML body of the HTA file, leading to the automatic execution of the received module.

404 Keylogger

Snake Keylogger (aka 404 Keylogger) is a subscription-based keylogger that has many capabilities. The infostealer can steal a victim's sensitive information, log keyboard strokes, take screenshots and extract information from the system clipboard. It was initially released on a Russian hacking forum in August 2019. It is notable for its relatively unusual methods of data exfiltration, including via email, FTP, SMTP, Pastebin or the messaging app Telegram.

The tag is: *misp-galaxy:malpedia="404 Keylogger"*

404 Keylogger is also known as:

7ev3n

The NJCCIC describes 7ev3n as a ransomware "that targets the Windows OS and spreads via spam emails containing malicious attachments, as well as file sharing networks. It installs multiple files in the LocalAppData folder, each of which controls different functions including disabling bootup recovery options, deleting the ransomware installation file, encrypting data, and gaining administrator privileges. This variant also adds registry keys that disables various Windows

function keys such as F1, F3, F4, F10, Alt, Num Lock, Ctrl, Enter, Escape, Shift, and Tab. Files encrypted by 7ev3n are labeled with a .R5A extension. It also locks victims out of Windows recovery options making it challenging to repair the damage done by 7ev3n."

8Base

The 8Base ransomware group has remained relatively unknown despite the massive spike in activity in Summer of 2023. The group utilizes encryption paired with “name-and-shame” techniques to compel their victims to pay their ransoms. 8Base has an opportunistic pattern of compromise with recent victims spanning across varied industries. Despite the high amount of compromises, the information regarding identities, methodology, and underlying motivation behind these incidents still remains a mystery. Samples of their ransomware show they are using customized Phobos with SmokeLoader.

8.t Dropper

8T_Dropper has been used by Chinese threat actor TA428 in order to install Cotx RAT onto victim's machines during Operation LagTime IT. According to Proofpoint the attack was developed against a number of government agencies in East Asia overseeing government information technology, domestic affairs, foreign affairs, economic development, and political processes. The dropper was delivered through an RTF document exploiting CVE-2018-0798.

9002 RAT

9002 RAT is a Remote Access Tool typically observed to be used by an APT to control a victim's machine. It has been spread over via zero day exploits (e.g. targeting Internet Explorer) as well as via email attachments. The infection chain starts by opening a .LNK (an OLE packager shell object) that executes a Powershell command.

The tag is: *misp-galaxy:malpedia="9002 RAT"*

9002 RAT is also known as:

- HOMEUNIX
- Hydraq
- McRAT

ACBackdoor (Windows)

A Linux backdoor that was apparently ported to Windows. This entry represents the Windows version. It appears the Linux version was written first and the Windows version was ported later, without full functionality. The Linux version offers persistence as well as some process manipulation techniques, though both versions apparently offer the ability to access the command line and execute programs as well as self-update.

The tag is: *misp-galaxy:malpedia="ACBackdoor (Windows)"*

AcidBox

Unit42 found AcidBox in February 2019 and describes it as a malware family used by an unknown threat actor in 2017 against Russian entities, as stated by Dr.Web. It reused and improved an exploit for VirtualBox previously used by Turla. The malware itself is a modular toolkit, featuring both usermode and kernelmode components and anti-analysis techniques such as stack-based string obfuscation or dynamic XOR-encoded API usage.

The tag is: *misp-galaxy:malpedia="AcidBox"*

AcidBox is also known as:

- MagicScroll

ACR Stealer

First introduced in March 2024, ACR Stealer is an information stealer sold as a Malware-as-a-Service (MaaS) on Russian-speaking cybercrime forums by a threat actor named "SheldIO". Researchers posit that this malware is an evolved version of the GrMsk Stealer, which likely aligns with the private stealer that SheldIO has been selling since July 2023. The malware, written in C++, is compatible with Windows 7 through 10, and the seller manages all command and control (C2) infrastructure. ACR Stealer can harvest system information, stored credentials, web browser cookies, cryptocurrency wallets, and configuration files for various programs. Additionally, it employs the dead drop resolver (DDR) technique to obfuscate the actual C2 infrastructure.

The tag is: *misp-galaxy:malpedia="ACR Stealer"*

ACR Stealer is also known as:

Agent Racoon

Agent Racoon is a .NET-based backdoor malware that leverages DNS for covert C2 communication, employing randomized subdomains and Punycode encoding to evade detection. It features encrypted communication using a unique key per sample, supports remote command execution, and facilitates file transfers. Despite lacking an inherent persistence mechanism, it relies on external methods like scheduled tasks for execution. The malware, active since at least 2020, has targeted organizations in the U.S., Middle East, and Africa, including non-profits and government sectors. It disguises itself as legitimate binaries such as Google Update and MS OneDrive Updater, using obfuscation techniques like Base64 encoding and timestamp modifications to avoid detection.

The tag is: *misp-galaxy:malpedia="Agent Racoon"*

Agent Tesla

A .NET based information stealer readily available to actors due to leaked builders. The malware is able to log keystrokes, can access the host's clipboard and crawls the disk for credentials or other valuable information. It has the capability to send information back to its C&C via HTTP(S), SMTP, FTP, or towards a Telegram channel.

The tag is: *misp-galaxy:malpedia="Agent Tesla"*

Agent Tesla is also known as:

- AgenTesla
- AgentTesla
- Negasteal

AgfSpy

The agfSpy backdoor retrieves configuration and commands from its C&C server. These commands allow the backdoor to execute shell commands and send the execution results back to the server. It also enumerates directories and can list, upload, download, and execute files, among other functions. The capabilities of agfSpy are very similar to dneSpy, except each backdoor uses a different C&C server and various formats in message exchanges.

AkdoorTea

AkdoorTea is a simple TCP RAT.

In August 2025, it was contained in a trojanized Nvidia CUDA toolkit package, delivered probably via the ClickFix technique. The package also contained an obfuscated BeaverTail payload, which suggests its attribution to the Contagious Interview campaigns.

AkdoorTea uses Base64 encryption combined with a single-byte XOR key for network traffic obfuscation.

The RAT supports five commands, one of which is to report its internal version, which is "01.01".

Its name was inspired by the similarity to a TCP RAT, referred to as "Akdoor", that was used in

attacks leveraging ActiveX exploits against South Korean targets in April 2018.

Aldibot

According to Trend Micro Encyclopia: ALDIBOT first appeared in late August 2012 in relevant forums. Variants can steal passwords from the browser Mozilla Firefox, instant messenger client Pidgin, and the download manager jDownloader. ALDIBOT variants send the gathered information to their command-and-control (C&C) servers.

This malware family can also launch Distributed Denial of Service (DDoS) attacks using different protocols such as HTTP, TCP, UDP, and SYN. It can also perform flood attacks via Slowloris and Layer 7.

This bot can also be set up as a SOCKS proxy to abuse the infected machine as a proxy for any protocols.

This malware family can download and execute arbitrary files, and update itself. Variants can steal information, gathering the infected machine's hardware identification (HWID), host name, local IP address, and OS version.

This backdoor executes commands from a remote malicious user, effectively compromising the affected system.

AlphaLocker

A new form of ransomware named AlphaLocker that is built by cybercriminals for cybercriminals. Like all incarnations of Ransomware As A Service (RaaS), the AlphaLocker malware program can be purchased and launched by pretty much anyone who wants to get into the ransomware business. What makes AlphaLocker different from other forms of RaaS is its relatively cheap cost. The ransomware can be purchased for just $65 in bitcoin.

AlphaLocker, also known as Alpha Ransomware, is based on the EDA2 ransomware, an educational project open-sourced on GitHub last year by Turkish researcher Utku Sen. A Russian coder seems to have cloned this repository before it was taken down and used it to create his ransomware, a near-perfect clone of EDA2. The ransomware's author, is said to be paying a great deal of attention to updating the ransomware with new features, so it would always stay ahead of antivirus engines, and evade detection.

AlphaLocker's encryption process starts when the ransomware contacts its C&C server. The server generates a public and a private key via the RSA-2048 algorithm, sending the public key to the user's computer and saving the private key to its server. On the infected computer, the ransomware generates an AES-256 key for each file it encrypts, and then encrypts this key with the public RSA key, and sent to the C&C server.

To decrypt their files, users have to get ahold of the private RSA key which can decrypt the AES-encrypted files found on their computers. Users have to pay around 0.35 Bitcoin (~$450) to get this key, packaged within a nice decrypter.

Alreay

Alreay is a remote access trojan that uses HTTP(S) or TCP for communication with its C&C server.

It uses either RC4 or DES for encryption of its configuration, which is stored in the registry.

It sends detailed information about the victim's environment, like computer name, Windows version, system locale, and network configuration.

It supports almost 25 commands that include operations on the victim's filesystem, basic process management, file exfiltration, command line execution, and process injection of an executable downloaded from the attacker's C&C server. As in many RATs from Lazarus arsenal, the commands are indexed by 32-bit integers, starting with values like 0x21A8B293, 0x23FAE29C or 0x91B93485.

It comes either as an EXE or as a DLL with the internal DLL name t_client_dll.dll. It may contain statically linked code from open-source libraries like Mbed TLS or zLib (version 1.0.1).

Alreay RAT was observed in 2016-2017, running on networks of banks operating SWIFT Alliance software.

Anatova Ransomware

Anatova is a ransomware family with the goal of ciphering all the files that it can and then requesting payment from the victim. It will also check if network shares are connected and will encrypt the files on these shares too. The code is also prepared to support modular extensions.

The tag is: *misp-galaxy:malpedia="Anatova Ransomware"*

Anatova Ransomware is also known as:

Anchor

Anchor is a sophisticated backdoor served as a module to a subset of TrickBot installations. Operating since August 2018 it is not delivered to everybody, but contrary is delivered only to high-profile targets. Since its C2 communication scheme is very similar to the one implemented in the early TrickBot, multiple experts believe it could be attributed to the same authors.

The tag is: *misp-galaxy:malpedia="Anchor"*

AndroMut

According to Proofpoint, AndroMut is a new downloader malware written in C++ that Proofpoint researchers began observing in the wild in June 2019. The “Andro” part of the name comes from some of the pieces which bear resemblance to another downloader malware known as Andromeda [1] and “Mut” is based off a mutex that the analyzed sample creates: “mutshellmy777”.

The tag is: *misp-galaxy:malpedia="AndroMut"*

AndroMut is also known as:

- Gelup

ArdaMax

According to f-secure, Ardamax is a commercial keylogger program that can be installed onto the system from the product's website.& When run, the program can capture a range of user activities,

such as keystrokes typed, instant messenger chat logs, web browser activity and even screenshots of the active desktop.

This program can be configured to a complete stealth mode, with password protection, to avoid user detection.

The information gathered is stored in an encrypted log file, which is only viewable using the built-in Log Viewer. The log file can be sent to an external party through e-mail, via a local area network (LAN) or by upload to an FTP server (in either HTML or encrypted format).

AresLoader

AresLoader is a new malware "downloader" that has been advertised on some Russian language Dark Web forums “RAMP and "XSS" by a threat actor called "DarkBLUP". Researchers assess this loader is likely a legitimate penetration testing tool that is now being abused by threat actors. This is because of a similar project, dubbed “Project Ares,” was previously uploaded to GitHub as a proof-of-concept (PoC) by the well-regarded user and red teamer “CerberSec.”

The loader mimics legitimate software to trick victims into executing malware with administrator rights on their machines. Additional features of the loader include:

1. Written in C/C++
2. Supports 64-bit payloads
3. Makes it look like malware spawned by another process
4. Prevents non-Microsoft signed binaries from being injected into malware
5. Hides suspicious imported Windows APIs
6. Leverages anti-analysis techniques to avoid reverse engineering

Furthermore, It was observed that SystemBC, Amadey, and several Raccoon Stealers were directly installing AresLoader. To date, the AresLoader downloader has been seen delivering payloads like SystemBC, Lumma Stealer, StealC, Aurora Stealer, and Laplas Clipper.

ArguePatch

During a campaign against a Ukrainian energy provider, a new loader of a new version of CaddyWiper called "ArguePatch" was observed by ESET researchers. ArguePatch is a modified version of Hex-Ray’s Remote Debugger Server (win32_remote.exe). ArguePatch expects a

decryption key and the file of the CaddyWiper shellcode as command line parameters.

Arkei Stealer

Arkei is a stealer that appeared around May 2018. It collects data about browsers (saved passwords and autofill forms), cryptocurrency wallets, and steal files matching an attacker-defined pattern. It then exfiltrates everything in a zip file uploaded to the attacker’s panel. Later, it was forked and used as a base to create Vidar stealer.

The tag is: *misp-galaxy:malpedia="Arkei Stealer"*

Arkei Stealer is also known as:

- ArkeiStealer

AsyncRAT

AsyncRAT is a Remote Access Tool (RAT) designed to remotely monitor and control other computers through a secure encrypted connection. It is an open source remote administration tool, however, it could also be used maliciously because it provides functionality such as keylogger, remote desktop control, and many other functions that may cause harm to the victim's computer. In addition, AsyncRAT can be delivered via various methods such as spear-phishing, malvertising, exploit kit and other techniques.

ATOMSILO

According to PCrisk, AtomSilo is a type of malware that blocks access to files by encrypting them and renames every encrypted file by appending the ".ATOMSILO" to its filename. It renames "1.jpg" to "1.jpg.ATOMSILO", "2.jpg" to "2.jpg.ATOMSILO", and so on. As its ransom note, AtomSilo creates the "README-FILE-COMPUTER-NAME-CREATION-TIME.hta" file.

Attor

Attor is a cyberespionage platform used in targeted attacks against diplomatic missions and governmental institutions since at least 2013. Its most interesting features are a complex modular architecture, elaborate network communications, and a unique plugin to fingerprint GSM/GPRS devices.

Attor's core lies in its dispatcher, which serves as a management unit for additional plugins which provide all of malware's key capabilities. This allows the attackers to customize the platform on a per-victim basis. Plugins themselves are heavily synchronized. Network communication is based on Tor, aiming for anonymity and untraceability.

The most notable plugin can detect connected GSM/GPRS modems or mobile devices. Attor speaks to them directly using the AT command set, in order to collect sensitive information such as the IMEI, IMSI or MSISDN numbers, possibly identifying both the device and its subscriber. Other plugins provide persistence, an exfiltration channel, C&C communication and several further spying capabilities. The plugin responsible for capturing victim's screen targets social networks and blogging platforms, email services, office software, archiving utilities, file sharing and messaging services.

Aura Stealer

In July 2025, threat actor AuraCorp began advertising Aura Stealer as a Malware-as-a-Service (MaaS) program with multiple subscription tiers on underground forums. The information stealer targets credentials from over 110 browsers, 70 applications, and 250+ browser extensions, including cryptocurrency wallets and 2FA tools, while using AES-256 encryption for C2 communications. Notable features include seamless Chromium cookie harvesting without process termination, server-side App-Bound data decryption, and a built-in payload loader with custom morphing for detection evasion.

Aurora Stealer

First advertised as a Malware-as-a-Service (MaaS) on Russian-speaking underground forums in April 2022, Aurora Stealer is a Golang-based information stealer with downloading and remote access capabilities. The malware targets data from multiple browsers, cryptocurrency wallets, local systems, and act as a loader. During execution, the malware runs several commands through WMIC to collect basic host information, snaps a desktop image, and exfiltrates data to the C2 server within a single base64-encoded JSON file.

The tag is: *misp-galaxy:malpedia="Aurora Stealer"*

AVCrypt

Bleeping Computer notes about discovery of AVCrypt, a malware that tries to uninstall existing security software before it encrypts a computer. Furthermore, as it removes numerous services, including Windows Update, and provides no contact information, this ransomware may be a wiper.

The tag is: *misp-galaxy:malpedia="AVCrypt"*

AVCrypt is also known as:
