Unsigned .node File Loaded

Detects the loading of unsigned .node files. Adversaries may abuse a lack of .node integrity checking to execute arbitrary code inside of trusted applications such as Slack. .node files are native add-ons for Electron-based applications, which are commonly used for desktop applications like Slack, Discord, and Visual Studio Code. This technique has been observed in the DripLoader malware, which uses unsigned .node files to load malicious native code into Electron applications.

The tag is: *misp-galaxy:sigma-rules="Unsigned .node File Loaded"*

View relationships graph

Unsigned .node File Loaded has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Shared Modules - T1129" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="DLL - T1574.001" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Match Legitimate Resource Name or Location - T1036.005" with estimative-language:likelihood-probability="almost-certain"

Suspicious Unsigned Dbghelp/Dbgcore DLL Loaded

Detects the load of dbghelp/dbgcore DLL (used to make memory dumps) by suspicious processes. Tools like ProcessHacker and some attacker tradecract use MiniDumpWriteDump API found in dbghelp.dll or dbgcore.dll. As an example, SilentTrynity C2 Framework has a module that leverages this API to dump the contents of Lsass.exe and transfer it over the network back to the attacker's machine.

The tag is: *misp-galaxy:sigma-rules="Suspicious Unsigned Dbghelp/Dbgcore DLL Loaded"*

View relationships graph

Suspicious Unsigned Dbghelp/Dbgcore DLL Loaded has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="LSASS Memory - T1003.001" with estimative-

language:likelihood-probability="almost-certain"

Python Image Load By Non-Python Process

Detects the image load of "Python Core" by a non-Python process. This might be indicative of a execution of executable that has been bundled from Python code. Various tools like Py2Exe, PyInstaller, and cx_Freeze are used to bundle Python code into standalone executables. Threat actors often use these tools to bundle malicious Python scripts into executables, sometimes to obfuscate the code or to bypass security measures.

The tag is: *misp-galaxy:sigma-rules="Python Image Load By Non-Python Process"*

View relationships graph

Python Image Load By Non-Python Process has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Software Packing - T1027.002" with estimative-language:likelihood-probability="almost-certain"

Load Of RstrtMgr.DLL By A Suspicious Process

Detects the load of RstrtMgr DLL (Restart Manager) by a suspicious process. This library has been used during ransomware campaigns to kill processes that would prevent file encryption by locking them (e.g. Conti ransomware, Cactus ransomware). It has also recently been seen used by the BiBi wiper for Windows. It could also be used for anti-analysis purposes by shut downing specific processes.

The tag is: *misp-galaxy:sigma-rules="Load Of RstrtMgr.DLL By A Suspicious Process"*

View relationships graph

Load Of RstrtMgr.DLL By A Suspicious Process has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Data Encrypted for Impact - T1486" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001" with estimative-language:likelihood-probability="almost-certain"

BaaUpdate.exe Suspicious DLL Load

Detects BitLocker Access Agent Update Utility (baaupdate.exe) loading DLLs from suspicious locations that are publicly writable which could indicate an attempt to lateral movement via

BitLocker DCOM & COM Hijacking. This technique abuses COM Classes configured as INTERACTIVE USER to spawn processes in the context of the logged-on user's session. Specifically, it targets the BDEUILauncher Class (CLSID ab93b6f1-be76-4185-a488-a9001b105b94) which can launch BaaUpdate.exe, which is vulnerable to COM Hijacking when started with input parameters. This allows attackers to execute code in the user's context without needing to steal credentials or use additional techniques to compromise the account.

The tag is: *misp-galaxy:sigma-rules="BaaUpdate.exe Suspicious DLL Load"*

View relationships graph

BaaUpdate.exe Suspicious DLL Load has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="System Binary Proxy Execution - T1218" with estimative-language:likelihood-probability="almost-certain"

WerFaultSecure Loading DbgCore or DbgHelp - EDR-Freeze

Detects WerFaultSecure.exe loading dbgcore.dll or dbghelp.dll which contains the MiniDumpWriteDump function. The MiniDumpWriteDump function creates a minidump of a process by suspending all threads in the target process to ensure a consistent memory snapshot. The EDR-Freeze technique abuses WerFaultSecure.exe running as a Protected Process Light (PPL) with WinTCB protection level to suspend EDR/AV processes. By leveraging MiniDumpWriteDump's thread suspension behavior, edr-freeze allows malicious activity to execute undetected during the suspension period.

The tag is: *misp-galaxy:sigma-rules="WerFaultSecure Loading DbgCore or DbgHelp - EDR-Freeze"*

View relationships graph

WerFaultSecure Loading DbgCore or DbgHelp - EDR-Freeze has relationships with:

Powershell Execute Batch Script

Adversaries may abuse the Windows command shell for execution. The Windows command shell ([cmd](https://attack.mitre.org/software/S0106)) is the primary command prompt on Windows systems. The Windows command prompt can be used to control almost any aspect of a system, with various permission levels required for different subsets of commands. Batch files (ex: .bat or .cmd) also provide the shell with a list of sequential commands to run, as well as normal scripting operations such as conditionals and loops. Common uses of batch files include long or repetitive tasks, or the need to run the same set of commands on multiple system

The tag is: *misp-galaxy:sigma-rules="Powershell Execute Batch Script"*

Registry-Free Process Scope COR_PROFILER

Adversaries may leverage the COR_PROFILER environment variable to hijack the execution flow of programs that load the .NET CLR. The COR_PROFILER is a .NET Framework feature which allows developers to specify an unmanaged (or external of .NET) profiling DLL to be loaded into each .NET process that loads the Common Language Runtime (CLR). These profiliers are designed to monitor, troubleshoot, and debug managed code executed by the .NET CLR. (Citation: Microsoft Profiling Mar 2017) (Citation: Microsoft COR_PROFILER Feb 2013)

The tag is: *misp-galaxy:sigma-rules="Registry-Free Process Scope COR_PROFILER"*

Registry Modification Attempt Via VBScript - PowerShell

Detects attempts to modify the registry using VBScript's CreateObject("Wscript.shell") and RegWrite methods embedded within PowerShell scripts or commands. Threat actors commonly embed VBScript code within PowerShell to perform registry modifications, attempting to evade detection that monitors for direct registry access through traditional tools. This technique can be used for persistence, defense evasion, and privilege escalation by modifying registry keys without using regedit.exe, reg.exe, or PowerShell's native registry cmdlets.

The tag is: *misp-galaxy:sigma-rules="Registry Modification Attempt Via VBScript - PowerShell"*

View relationships graph

Registry Modification Attempt Via VBScript - PowerShell has relationships with:

Suspicious Process Access to LSASS with Dbgcore/Dbghelp DLLs

Detects suspicious process access to LSASS.exe from processes located in uncommon locations with dbgcore.dll or dbghelp.dll in the call trace. These DLLs contain functions like MiniDumpWriteDump that can be abused for credential dumping purposes. While modern tools like Mimikatz have moved to using ntdll.dll, dbgcore.dll and dbghelp.dll are still used by basic credential dumping utilities and legacy tools for LSASS memory access and process suspension techniques.

The tag is: *misp-galaxy:sigma-rules="Suspicious Process Access to LSASS with Dbgcore/Dbghelp DLLs"*

View relationships graph

Suspicious Process Access to LSASS with Dbgcore/Dbghelp DLLs has relationships with:

Suspicious DNS Query Indicating Kerberos Coercion via DNS Object SPN Spoofing - Network

Detects DNS queries containing patterns associated with Kerberos coercion attacks via DNS object spoofing. The pattern "1UWhRCAAAAA..BAAAA" is a base64-encoded signature that corresponds to a marshaled CREDENTIAL_TARGET_INFORMATION structure. Attackers can use this technique to coerce authentication from victim systems to attacker-controlled hosts. It is one of the strong indicators of a Kerberos coercion attack, where adversaries manipulate DNS records to spoof Service Principal Names (SPNs) and redirect authentication requests like CVE-2025-33073.

The tag is: *misp-galaxy:sigma-rules="Suspicious DNS Query Indicating Kerberos Coercion via DNS Object SPN Spoofing - Network"*

View relationships graph

Suspicious DNS Query Indicating Kerberos Coercion via DNS Object SPN Spoofing - Network has

relationships with:

Suspicious DNS Z Flag Bit Set

The DNS Z flag is bit within the DNS protocol header that is, per the IETF design, meant to be used reserved (unused). Although recently it has been used in DNSSec, the value being set to anything other than 0 should be rare. Otherwise if it is set to non 0 and DNSSec is being used, then excluding the legitimate domains is low effort and high reward. Determine if multiple of these files were accessed in a short period of time to further enhance the possibility of seeing if this was a one off or the possibility of larger sensitive file gathering. This Sigma query is designed to accompany the Corelight Threat Hunting Guide, which can be found here: https://www3.corelight.com/corelights-introductory-guide-to-threat-hunting-with-zeek-bro-logs'

https://github.com/SigmaHQ/sigma/tree/master/rules/application/jvm/java_xxe_exploitation_attempt.yml

Potential Local File Read Vulnerability In JVM Based Application

Detects potential local file read vulnerability in JVM based apps. If the exceptions are caused due to

user input and contain path traversal payloads then it's a red flag.

The tag is: *misp-galaxy:sigma-rules="Potential Local File Read Vulnerability In JVM Based Application"*

View relationships graph

Potential Local File Read Vulnerability In JVM Based Application has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Exploit Public-Facing Application - T1190" with estimative-language:likelihood-probability="almost-certain"

Table 16852. Table References

Links
https://www.wix.engineering/post/threat-and-vulnerability-hunting-with-application-server-error-logs
https://github.com/SigmaHQ/sigma/tree/master/rules/application/jvm/java_local_file_read.yml

Potential OGNL Injection Exploitation In JVM Based Application

Detects potential OGNL Injection exploitation, which may lead to RCE. OGNL is an expression language that is supported in many JVM based systems. OGNL Injection is the reason for some high profile RCE's such as Apache Struts (CVE-2017-5638) and Confluence (CVE-2022-26134)

The tag is: *misp-galaxy:sigma-rules="Potential OGNL Injection Exploitation In JVM Based Application"*

View relationships graph

Potential OGNL Injection Exploitation In JVM Based Application has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Exploit Public-Facing Application - T1190" with estimative-language:likelihood-probability="almost-certain"

Table 16853. Table References

Github Outside Collaborator Detected

Detects when an organization member or an outside collaborator is added to or removed from a project board or has their permission level changed or when an owner removes an outside collaborator from an organization or when two-factor authentication is required in an organization and an outside collaborator does not use 2FA or disables 2FA.

The tag is: *misp-galaxy:sigma-rules="Github Outside Collaborator Detected"*

View relationships graph

Github Outside Collaborator Detected has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Additional Cloud Credentials - T1098.001" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Additional Cloud Roles - T1098.003" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Code Repositories - T1213.003" with estimative-language:likelihood-probability="almost-certain"

Github Self Hosted Runner Changes Detected

A self-hosted runner is a system that you deploy and manage to execute jobs from GitHub Actions on GitHub.com. This rule detects changes to self-hosted runners configurations in the environment. The self-hosted runner configuration changes once detected, it should be validated from GitHub UI because the log entry may not provide full context.

The tag is: *misp-galaxy:sigma-rules="Github Self Hosted Runner Changes Detected"*

View relationships graph

Github Self Hosted Runner Changes Detected has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Cloud Service Discovery - T1526" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Code Repositories - T1213.003" with estimative-language:likelihood-probability="almost-certain"

Kubernetes CronJob/Job Modification

Detects when a Kubernetes CronJob or Job is created or modified. A Kubernetes Job creates one or more pods to accomplish a specific task, and a CronJob creates Jobs on a recurring schedule. An adversary can take advantage of this Kubernetes object to schedule Jobs to run containers that execute malicious code within a cluster, allowing them to achieve persistence.

The tag is: *misp-galaxy:sigma-rules="Kubernetes CronJob/Job Modification"*

Table 16915. Table References

Links

https://kubernetes.io/docs/reference/config-api/apiserver-audit.v1/
https://github.com/SigmaHQ/sigma/tree/master/rules/application/kubernetes/audit/kubernetes_audit_cronjob_modification.yml

RBAC Permission Enumeration Attempt

Detects identities attempting to enumerate their Kubernetes RBAC permissions. In the early stages of a breach, attackers will aim to list the permissions they have within the compromised environment. In a Kubernetes cluster, this can be achieved by interacting with the API server, and querying the SelfSubjectAccessReview API via e.g. a "kubectl auth can-i --list" command. This will enumerate the Role-Based Access Controls (RBAC) rules defining the compromised user's authorization.

The tag is: *misp-galaxy:sigma-rules="RBAC Permission Enumeration Attempt"*

View relationships graph

RBAC Permission Enumeration Attempt has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Cloud Groups - T1069.003" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Cloud Account - T1087.004" with estimative-language:likelihood-probability="almost-certain"

Table 16916. Table References

https://github.com/SigmaHQ/sigma/tree/master/rules/application/kubernetes/audit/kubernetes_audit_rbac_permisions_listing.yml

Creation Of Pod In System Namespace

Detects deployments of pods within the kube-system namespace, which could be intended to imitate system pods. System pods, created by controllers such as Deployments or DaemonSets have random suffixes in their names. Attackers can use this fact and name their backdoor pods as if they were created by these controllers to avoid detection. Deployment of such a backdoor container e.g. named kube-proxy-bv61v, could be attempted in the kube-system namespace alongside the other administrative containers.

The tag is: *misp-galaxy:sigma-rules="Creation Of Pod In System Namespace"*

View relationships graph

Creation Of Pod In System Namespace has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Match Legitimate Resource Name or Location - T1036.005" with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/application/kubernetes/audit/kubernetes_audit_pod_in_system_namespace.yml

Container With A hostPath Mount Created

Detects creation of a container with a hostPath mount. A hostPath volume mounts a directory or a file from the node to the container. Attackers who have permissions to create a new pod in the cluster may create one with a writable hostPath volume and chroot to escape to the underlying node.

The tag is: *misp-galaxy:sigma-rules="Container With A hostPath Mount Created"*

View relationships graph

Container With A hostPath Mount Created has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Escape to Host - T1611" with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/application/kubernetes/audit/kubernetes_audit_events_deleted.yml

Privileged Container Deployed

Detects the creation of a "privileged" container, an action which could be indicative of a threat actor mounting a container breakout attacks. A privileged container is a container that can access the host with all of the root capabilities of the host machine. This allows it to view, interact and modify processes, network operations, IPC calls, the file system, mount points, SELinux configurations etc. as the root user on the host. Various versions of "privileged" containers can be specified, e.g. by setting the securityContext.privileged flag in the resource specification, setting non-standard Linux capabilities, or configuring the hostNetwork/hostPID fields

The tag is: *misp-galaxy:sigma-rules="Privileged Container Deployed"*

View relationships graph

Privileged Container Deployed has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Escape to Host - T1611" with estimative-language:likelihood-probability="almost-certain"

Table 16920. Table References

https://github.com/SigmaHQ/sigma/tree/master/rules/application/kubernetes/audit/kubernetes_audit_privileged_pod_creation.yml

Deployment Deleted From Kubernetes Cluster

Detects the removal of a deployment from a Kubernetes cluster. This could indicate disruptive activity aiming to impact business operations.

The tag is: *misp-galaxy:sigma-rules="Deployment Deleted From Kubernetes Cluster"*

View relationships graph

Deployment Deleted From Kubernetes Cluster has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Network Denial of Service - T1498" with estimative-language:likelihood-probability="almost-certain"

Table 16921. Table References

Links
https://microsoft.github.io/Threat-Matrix-for-Kubernetes/techniques/Data%20destruction/
https://github.com/SigmaHQ/sigma/tree/master/rules/application/kubernetes/audit/kubernetes_audit_deployment_deleted.yml

Potential Sidecar Injection Into Running Deployment

Detects attempts to inject a sidecar container into a running deployment. A sidecar container is an additional container within a pod, that resides alongside the main container. One way to add containers to running resources like Deployments/DeamonSets/StatefulSets, is via a "kubectl patch" operation. By injecting a new container within a legitimate pod, an attacker can run their code and hide their activity, instead of running their own separated pod in the cluster.

The tag is: *misp-galaxy:sigma-rules="Potential Sidecar Injection Into Running Deployment"*

View relationships graph

Potential Sidecar Injection Into Running Deployment has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Container Administration Command - T1609" with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/cloud/aws/cloudtrail/aws_root_account_usage.yml

AWS New Lambda Layer Attached

Detects when a user attached a Lambda layer to an existing Lambda function. A malicious Lambda layer could execute arbitrary code in the context of the function's IAM role. This would give an adversary access to resources that the function has access to.

The tag is: *misp-galaxy:sigma-rules="AWS New Lambda Layer Attached"*

Table 17015. Table References

https://github.com/clearvector/lambda-spy
https://github.com/SigmaHQ/sigma/tree/master/rules/cloud/aws/cloudtrail/aws_new_lambda_layer_attached.yml

AWS VPC Flow Logs Deleted

Detects the deletion of one or more VPC Flow Logs in AWS Elastic Compute Cloud (EC2) through the DeleteFlowLogs API call. Adversaries may delete flow logs to evade detection or remove evidence of network activity, hindering forensic investigations and visibility into malicious operations.

The tag is: *misp-galaxy:sigma-rules="AWS VPC Flow Logs Deleted"*

Table 17016. Table References

Links
https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ec2/delete-flow-logs.html

AWS GuardDuty Detector Deleted Or Updated

Detects successful deletion or disabling of an AWS GuardDuty detector, possibly by an attacker trying to avoid detection of its malicious activities. Upon deletion, GuardDuty stops monitoring the environment and all existing findings are lost. Verify with the user identity that this activity is legitimate.

The tag is: *misp-galaxy:sigma-rules="AWS GuardDuty Detector Deleted Or Updated"*

View relationships graph

AWS GuardDuty Detector Deleted Or Updated has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Disable or Modify Cloud Logs - T1562.008" with estimative-language:likelihood-probability="almost-certain"

Ingress/Egress Security Group Modification

Detects when an account makes changes to the ingress or egress rules of a security group. This can indicate that an attacker is attempting to open up new attack vectors in the account, that they are trying to exfiltrate data over the network, or that they are trying to allow machines in that VPC/Subnet to contact a C&C server.

The tag is: *misp-galaxy:sigma-rules="Ingress/Egress Security Group Modification"*

View relationships graph

Ingress/Egress Security Group Modification has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Exploit Public-Facing Application - T1190" with estimative-language:likelihood-probability="almost-certain"

AWS SAML Provider Deletion Activity

Detects the deletion of an AWS SAML provider, potentially indicating malicious intent to disrupt administrative or security team access. An attacker can remove the SAML provider for the information security team or a team of system administrators, to make it difficult for them to work and investigate at the time of the attack and after it.

The tag is: *misp-galaxy:sigma-rules="AWS SAML Provider Deletion Activity"*

View relationships graph

AWS SAML Provider Deletion Activity has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Cloud Accounts - T1078.004" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Account Access Removal - T1531" with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/cloud/aws/cloudtrail/aws_rds_change_master_password.yml

AWS EnableRegion Command Monitoring

Detects the use of the EnableRegion command in AWS CloudTrail logs. While AWS has 30+ regions, some of them are enabled by default, others must be explicitly enabled in each account separately. There may be situations where security monitoring does not cover some new AWS regions. Monitoring the EnableRegion command is important for identifying potential persistence mechanisms employed by adversaries, as enabling additional regions can facilitate continued access and operations within an AWS environment.

The tag is: *misp-galaxy:sigma-rules="AWS EnableRegion Command Monitoring"*

Table 17056. Table References

AWS User Login Profile Was Modified

Detects activity when someone is changing passwords on behalf of other users. An attacker with the "iam:UpdateLoginProfile" permission on other users can change the password used to login to the AWS console on any user that already has a login profile setup.

The tag is: *misp-galaxy:sigma-rules="AWS User Login Profile Was Modified"*

View relationships graph

AWS User Login Profile Was Modified has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Account Manipulation - T1098" with estimative-language:likelihood-probability="almost-certain"

Table 17060. Table References

Links
https://github.com/RhinoSecurityLabs/AWS-IAM-Privilege-Escalation
https://github.com/SigmaHQ/sigma/tree/master/rules/cloud/aws/cloudtrail/aws_update_login_profile.yml

RDS Database Security Group Modification

Detects changes to the security group entries for RDS databases. This can indicate that a misconfiguration has occurred which potentially exposes the database to the public internet, a wider audience within the VPC or that removal of valid rules has occurred which could impact the availability of the database to legitimate services and users.

The tag is: *misp-galaxy:sigma-rules="RDS Database Security Group Modification"*

View relationships graph

RDS Database Security Group Modification has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Exploit Public-Facing Application - T1190" with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/cloud/aws/cloudtrail/aws_cloudtrail_security_group_change_rds.yml

AWS Console GetSigninToken Potential Abuse

Detects potentially suspicious events involving "GetSigninToken". An adversary using the "aws_consoler" tool can leverage this console API to create temporary federated credential that help obfuscate which AWS credential is compromised (the original access key) and enables the adversary to pivot from the AWS CLI to console sessions without the need for MFA using the new access key issued in this request.

The tag is: *misp-galaxy:sigma-rules="AWS Console GetSigninToken Potential Abuse"*

View relationships graph

AWS Console GetSigninToken Potential Abuse has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Cloud Services - T1021.007" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Application Access Token - T1550.001" with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/cloud/gcp/audit/gcp_full_network_traffic_packet_capture.yml

Google Cloud DNS Zone Modified or Deleted

Identifies when a DNS Zone is modified or deleted in Google Cloud.

The tag is: *misp-galaxy:sigma-rules="Google Cloud DNS Zone Modified or Deleted"*

Table 17072. Table References

Links
https://cloud.google.com/dns/docs/reference/v1/managedZones
https://github.com/SigmaHQ/sigma/tree/master/rules/cloud/gcp/audit/gcp_dns_zone_modified_or_deleted.yml

Google Cloud SQL Database Modified or Deleted

Detect when a Cloud SQL DB has been modified or deleted.

The tag is: *misp-galaxy:sigma-rules="Google Cloud SQL Database Modified or Deleted"*

Table 17073. Table References

Links
https://cloud.google.com/sql/docs/mysql/admin-api/rest/v1beta4/users/update
https://github.com/SigmaHQ/sigma/tree/master/rules/cloud/gcp/audit/gcp_sql_database_modified_or_deleted.yml

Google Cloud Kubernetes Admission Controller

Identifies when an admission controller is executed in GCP Kubernetes. A Kubernetes Admission controller intercepts, and possibly modifies, requests to the Kubernetes API server. The behavior of this admission controller is determined by an admission webhook (MutatingAdmissionWebhook or ValidatingAdmissionWebhook) that the user deploys in the cluster. An adversary can use such webhooks as the MutatingAdmissionWebhook for obtaining persistence in the cluster. For example, attackers can intercept and modify the pod creation operations in the cluster and add their malicious container to every created pod. An adversary can use the webhook ValidatingAdmissionWebhook, which could be used to obtain access credentials. An adversary could use the webhook to intercept the requests to the API server, record secrets, and other sensitive information.

The tag is: *misp-galaxy:sigma-rules="Google Cloud Kubernetes Admission Controller"*

View relationships graph

Google Cloud Kubernetes Admission Controller has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Unsecured Credentials - T1552" with estimative-language:likelihood-probability="almost-certain"

Google Workspace Application Access Level Modified

Detects when an access level is changed for a Google workspace application. An access level is part of BeyondCorp Enterprise which is Google Workspace's way of enforcing Zero Trust model. An adversary would be able to remove access levels to gain easier access to Google workspace resources.

The tag is: *misp-galaxy:sigma-rules="Google Workspace Application Access Level Modified"*

View relationships graph

Google Workspace Application Access Level Modified has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Additional Cloud Roles - T1098.003" with estimative-language:likelihood-probability="almost-certain"

Table 17083. Table References

Application Using Device Code Authentication Flow

Device code flow is an OAuth 2.0 protocol flow specifically for input constrained devices and is not used in all environments. If this type of flow is seen in the environment and not being used in an input constrained device scenario, further investigation is warranted. This can be a misconfigured application or potentially something malicious.

The tag is: *misp-galaxy:sigma-rules="Application Using Device Code Authentication Flow"*

View relationships graph

Application Using Device Code Authentication Flow has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078" with estimative-language:likelihood-probability="almost-certain"

Table 17161. Table References

Azure Kubernetes Admission Controller

Identifies when an admission controller is executed in Azure Kubernetes. A Kubernetes Admission controller intercepts, and possibly modifies, requests to the Kubernetes API server. The behavior of this admission controller is determined by an admission webhook (MutatingAdmissionWebhook or ValidatingAdmissionWebhook) that the user deploys in the cluster. An adversary can use such webhooks as the MutatingAdmissionWebhook for obtaining persistence in the cluster. For example, attackers can intercept and modify the pod creation operations in the cluster and add their malicious container to every created pod. An adversary can use the webhook ValidatingAdmissionWebhook, which could be used to obtain access credentials. An adversary could use the webhook to intercept the requests to the API server, record secrets, and other sensitive information.

The tag is: *misp-galaxy:sigma-rules="Azure Kubernetes Admission Controller"*

View relationships graph

Azure Kubernetes Admission Controller has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078" with estimative-language:likelihood-probability="almost-certain"

Azure Network Security Configuration Modified or Deleted

Identifies when a network security configuration is modified or deleted.

The tag is: *misp-galaxy:sigma-rules="Azure Network Security Configuration Modified or Deleted"*

Table 17225. Table References

Links
https://learn.microsoft.com/en-us/azure/role-based-access-control/resource-provider-operations
https://github.com/SigmaHQ/sigma/tree/master/rules/cloud/azure/activity_logs/azure_network_security_modified_or_deleted.yml

Azure Kubernetes CronJob

Identifies when a Azure Kubernetes CronJob runs in Azure Cloud. Kubernetes Job is a controller that creates one or more pods and ensures that a specified number of them successfully terminate. Kubernetes Job can be used to run containers that perform finite tasks for batch jobs. Kubernetes CronJob is used to schedule Jobs. An Adversary may use Kubernetes CronJob for scheduling execution of malicious code that would run as a container in the cluster.

The tag is: *misp-galaxy:sigma-rules="Azure Kubernetes CronJob"*

View relationships graph

Azure Kubernetes CronJob has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Cron - T1053.003" with estimative-language:likelihood-probability="almost-certain"

Table 17226. Table References

ASLR Disabled Via Sysctl or Direct Syscall - Linux

Detects actions that disable Address Space Layout Randomization (ASLR) in Linux, including: - Use of the `personality` syscall with the ADDR_NO_RANDOMIZE flag (0x0040000) - Modification of the /proc/sys/kernel/randomize_va_space file - Execution of the `sysctl` command to set `kernel.randomize_va_space=0` Disabling ASLR is often used by attackers during exploit development or to bypass memory protection mechanisms. A successful use of these methods can reduce the effectiveness of ASLR and make memory corruption attacks more reliable.

The tag is: *misp-galaxy:sigma-rules="ASLR Disabled Via Sysctl or Direct Syscall - Linux"*

View relationships graph

ASLR Disabled Via Sysctl or Direct Syscall - Linux has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Proc Memory - T1055.009" with estimative-language:likelihood-probability="almost-certain"

Potential Abuse of Linux Magic System Request Key

Detects the potential abuse of the Linux Magic SysRq (System Request) key by adversaries with root or sufficient privileges to silently manipulate or destabilize a system. By writing to /proc/sysrq-trigger, they can crash the system, kill processes, or disrupt forensic analysis—all while bypassing standard logging. Though intended for recovery and debugging, SysRq can be misused as a stealthy post-exploitation tool. It is controlled via /proc/sys/kernel/sysrq or permanently through /etc/sysctl.conf.

The tag is: *misp-galaxy:sigma-rules="Potential Abuse of Linux Magic System Request Key"*

View relationships graph

Potential Abuse of Linux Magic System Request Key has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Unix Shell - T1059.004" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="System Shutdown/Reboot - T1529" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Service Stop - T1489" with estimative-language:likelihood-probability="almost-certain"

Clear or Disable Kernel Ring Buffer Logs via Syslog Syscall

Detects the use of the `syslog` syscall with action code 5 (SYSLOG_ACTION_CLEAR), (4 is SYSLOG_ACTION_READ_CLEAR and 6 is SYSLOG_ACTION_CONSOLE_OFF) which clears the kernel ring buffer (dmesg logs). This can be used by attackers to hide traces after exploitation or privilege escalation. A common technique is running `dmesg -c`, which triggers this syscall internally.

The tag is: *misp-galaxy:sigma-rules="Clear or Disable Kernel Ring Buffer Logs via Syslog Syscall"*

View relationships graph

Clear or Disable Kernel Ring Buffer Logs via Syslog Syscall has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Clear Linux or Mac System Logs - T1070.002" with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/linux/auditd/syscall/lnx_auditd_network_service_scanning.yml

System Info Discovery via Sysinfo Syscall

Detects use of the sysinfo system call in Linux, which provides a snapshot of key system statistics such as uptime, load averages, memory usage, and the number of running processes. Malware or reconnaissance tools might leverage sysinfo to fingerprint the system - gathering data to determine if it’s a viable target.

The tag is: *misp-galaxy:sigma-rules="System Info Discovery via Sysinfo Syscall"*

View relationships graph

System Info Discovery via Sysinfo Syscall has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Process Discovery - T1057" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="System Information Discovery - T1082" with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/linux/auditd/syscall/lnx_auditd_susp_discovery_sysinfo_syscall.yml

Special File Creation via Mknod Syscall

Detects usage of the `mknod` syscall to create special files (e.g., character or block devices). Attackers or malware might use `mknod` to create fake devices, interact with kernel interfaces, or establish covert channels in Linux systems. Monitoring the use of `mknod` is important because this syscall is rarely used by legitimate applications, and it can be abused to bypass file system restrictions or create backdoors.

The tag is: *misp-galaxy:sigma-rules="Special File Creation via Mknod Syscall"*

View relationships graph

Special File Creation via Mknod Syscall has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Windows Service - T1543.003" with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/linux/process_creation/proc_creation_lnx_clear_logs.yml

Suspicious Download and Execute Pattern via Curl/Wget

Detects suspicious use of command-line tools such as curl or wget to download remote content - particularly scripts - into temporary directories (e.g., /dev/shm, /tmp), followed by immediate execution, indicating potential malicious activity. This pattern is commonly used by malicious scripts, stagers, or downloaders in fileless or multi-stage Linux attacks.

The tag is: *misp-galaxy:sigma-rules="Suspicious Download and Execute Pattern via Curl/Wget"*

View relationships graph

Suspicious Download and Execute Pattern via Curl/Wget has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Unix Shell - T1059.004" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Exploitation for Client Execution - T1203" with estimative-language:likelihood-probability="almost-certain"

Audit Rules Deleted Via Auditctl

Detects the execution of 'auditctl' with the '-D' command line parameter, which deletes all configured audit rules and watches on Linux systems. This technique is commonly used by attackers to disable audit logging and cover their tracks by removing monitoring capabilities. Removal of audit rules can significantly impair detection of malicious activities on the affected system.

The tag is: *misp-galaxy:sigma-rules="Audit Rules Deleted Via Auditctl"*

View relationships graph

Audit Rules Deleted Via Auditctl has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Disable or Modify Linux Audit System - T1562.012" with estimative-language:likelihood-probability="almost-certain"

Table 17317. Table References

Python WebServer Execution - Linux

Detects the execution of Python web servers via command line interface (CLI). After gaining access to target systems, adversaries may use Python's built-in HTTP server modules to quickly establish a web server without requiring additional software. This technique is commonly used in post-exploitation scenarios as it provides a simple method for transferring files between the compromised host and attacker-controlled systems.

The tag is: *misp-galaxy:sigma-rules="Python WebServer Execution - Linux"*

View relationships graph

Python WebServer Execution - Linux has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Exfiltration Over Unencrypted Non-C2 Protocol - T1048.003" with estimative-language:likelihood-probability="almost-certain"

Table 17353. Table References

https://github.com/SigmaHQ/sigma/tree/master/rules/linux/process_creation/proc_creation_lnx_clear_syslog.yml

Linux Setgid Capability Set on a Binary via Setcap Utility

Detects the use of the 'setcap' utility to set the 'setgid' capability (cap_setgid) on a binary file. This capability allows a non privileged process to make arbitrary manipulations of group IDs (GIDs), including setting its current GID to a value that would otherwise be restricted (i.e. GID 0, the root group). This behavior can be used by adversaries to backdoor a binary in order to escalate privileges again in the future if needed.

The tag is: *misp-galaxy:sigma-rules="Linux Setgid Capability Set on a Binary via Setcap Utility"*

View relationships graph

Linux Setgid Capability Set on a Binary via Setcap Utility has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Abuse Elevation Control Mechanism - T1548" with

estimative-language:likelihood-probability="almost-certain"

- related-to: misp-galaxy:mitre-attack-pattern="Compromise Host Software Binary - T1554" with estimative-language:likelihood-probability="almost-certain"

Mask System Power Settings Via Systemctl

Detects the use of systemctl mask to disable system power management targets such as suspend, hibernate, or hybrid sleep. Adversaries may mask these targets to prevent a system from entering sleep or shutdown states, ensuring their malicious processes remain active and uninterrupted. This behavior can be associated with persistence or defense evasion, as it impairs normal system power operations to maintain long-term access or avoid termination of malicious activity.

The tag is: *misp-galaxy:sigma-rules="Mask System Power Settings Via Systemctl"*

View relationships graph

Mask System Power Settings Via Systemctl has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Power Settings - T1653" with estimative-language:likelihood-probability="almost-certain"

OMIGOD SCX RunAsProvider ExecuteScript

Rule to detect the use of the SCX RunAsProvider ExecuteScript to execute any UNIX/Linux script using the /bin/sh shell. Script being executed gets created as a temp file in /tmp folder with a scx* prefix. Then it is invoked from the following directory /etc/opt/microsoft/scx/conf/tmpdir/. The file in that directory has the same prefix scx*. SCXcore, started as the Microsoft Operations Manager UNIX/Linux Agent, is now used in a host of products including Microsoft Operations Manager, Microsoft Azure, and Microsoft Operations Management Suite.

The tag is: *misp-galaxy:sigma-rules="OMIGOD SCX RunAsProvider ExecuteScript"*

View relationships graph

OMIGOD SCX RunAsProvider ExecuteScript has relationships with:

Linux Setuid Capability Set on a Binary via Setcap Utility

Detects the use of the 'setcap' utility to set the 'setuid' capability (cap_setuid) on a binary file. This capability allows a non privileged process to make arbitrary manipulations of user IDs (UIDs), including setting its current UID to a value that would otherwise be restricted (i.e. UID 0, the root user). This behavior can be used by adversaries to backdoor a binary in order to escalate privileges again in the future if needed.

The tag is: *misp-galaxy:sigma-rules="Linux Setuid Capability Set on a Binary via Setcap Utility"*

View relationships graph

Linux Setuid Capability Set on a Binary via Setcap Utility has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Abuse Elevation Control Mechanism - T1548" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Compromise Host Software Binary - T1554" with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/linux/process_creation/proc_creation_lnx_dd_file_overwrite.yml

Linux Sudo Chroot Execution

Detects the execution of 'sudo' command with '--chroot' option, which is used to change the root directory for command execution. Attackers may use this technique to evade detection and execute commands in a modified environment. This can be part of a privilege escalation strategy, as it allows the execution of commands with elevated privileges in a controlled environment as seen in CVE-2025-32463. While investigating, look out for unusual or unexpected use of 'sudo --chroot' in conjunction with other commands or scripts such as execution from temporary directories or unusual user accounts.

The tag is: *misp-galaxy:sigma-rules="Linux Sudo Chroot Execution"*

View relationships graph

Linux Sudo Chroot Execution has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Exploitation for Privilege Escalation - T1068" with estimative-language:likelihood-probability="almost-certain"

Stealer

A list of malware stealer..

Stealer is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

raw-data

Nocturnal Stealer

It is designed to steal data found within multiple Chromium and Firefox based browsers, it can also steal many popular cryptocurrency wallets as well as any saved FTP passwords within FileZilla. Nocturnal Stealer uses several anti-VM and anti-analysis techniques, which include but are not limited to: environment fingerprinting, checking for debuggers and analyzers, searching for known virtual machine registry keys, and checking for emulation software.

Prynt Stealer

Prynt Stealer is an information stealer that has the ability to capture credentials that are stored on

a compromised system including web browsers, VPN/FTP clients, as well as messaging and gaming applications. Its developer based the malware code on open source projects including AsyncRAT and StormKitty. Prynt Stealer uses Telegram to exfiltrate data that is stolen from victims. Its author added a backdoor Telegram channel to collect the information stolen by other criminals.

The tag is: *misp-galaxy:stealer="Prynt Stealer"*

View relationships graph

Prynt Stealer has relationships with:

Oski Stealer

The Oski stealer is a malicious information stealer, which was first introduced in November 2019. As the name implies, the Oski stealer steals personal and sensitive information from its target. “Oski” is derived from an old Nordic word meaning Viking warrior, which is quite fitting considering this popular info-stealer is extremely effective at pillaging privileged information from its victims.

The tag is: *misp-galaxy:stealer="Oski Stealer"*

Surveillance Vendor

List of vendors selling surveillance technologies including malware, interception devices or computer exploitation services..

Surveillance Vendor is a cluster galaxy available in JSON format at **this location** The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Various

Kape Technologies

Kape Technologies is better known by the name under which they were formerly incorporated - "Crossrider" but make no mistake they are the same company which became notorious as an adware/malware producer. Kape Technologies was originally known as Crossrider until the name change in 2018. The reason for that was, as CEO Ido Erlichman put it, “strong association to the past activities of the company.” Perhaps that refers to infecting users’ devices with malware and adware, considered “high-risk” by Symantec and Malwarebytes. If that wasn’t enough, Crossrider’s Founder and first CEO Koby Menachemi, was part of Unit 8200 – something that can be called Israel’s NSA. Another key person, Teddy Sagi, who is the main investor in both Crossrider and Kape Technologies, is mentioned in the Panama Papers.

The tag is: *misp-galaxy:surveillance-vendor="Kape Technologies"*

Kape Technologies is also known as:

- Kape
- Crossrider

Hacking Team

HackingTeam is a Milan-based information technology company that sells offensive intrusion and surveillance capabilities to governments, law enforcement agencies and corporations. Its "Remote Control Systems" enable governments and corporations to monitor the communications of internet users, decipher their encrypted files and emails, record Skype and other Voice over IP communications, and remotely activate microphones and camera on target computers. The company has been criticized for providing these capabilities to governments with poor human rights records, though HackingTeam states that they have the ability to disable their software if it is used unethically. The Italian government has restricted their license to do business with countries outside Europe. HackingTeam employs around 40 people in its Italian office, and has subsidiary branches in Annapolis, Washington, D.C., and Singapore. Its products are in use in dozens of countries across six continents.

The tag is: *misp-galaxy:surveillance-vendor="Hacking Team"*

Hacking Team is also known as:

- Memento Labs

Table 17488. Table References

FlexiSPY

Flexispy is an application that can be considered as a trojan, based on Symbian. The program sends all information received and sent from the smartphone to a Flexispy server. It was originally created to protect children and spy on adulterous spouses.

The tag is: *misp-galaxy:surveillance-vendor="FlexiSPY"*

mSpy

mSpy is probably the most popular monitoring software on the market today. It is designed for parents who want to track their children's online activity. Using mSpy is easy — just download and install a hidden app on your child's phone and let it do its thing in the background. mSpy is available for iOS and Android, and has a web-based control panel that allows you to remotely monitor activity on your child's device, including texts, instant messages, phone calls and social media use on Snapchat or Facebook. It also allows you to track the location of your child's device on a map. The best thing about mSpy is that it works on non-jailbroken iPhones. Do note that some of its features, including email tracking and instant messenger monitoring, are only available on a rooted Android smartphone. If you don't know how to root an Android device, you might want to consider using a spy app like Highster Mobile. This app lets you spy on Android phone without rooting.

The tag is: *misp-galaxy:surveillance-vendor="mSpy"*

Table 17490. Table References

Links
https://www.bestphonespy.com/mspy-review/

Highster Mobile

Highster Mobile is a cell phone spy and monitoring software that allows you to secretly monitor your children, employees, or loved ones without them ever knowing it. The app is available for both Android and iOS devices and is developed by ILF Mobile Apps, a company based in Bohemia, New York, that specializes in mobile security.

The tag is: *misp-galaxy:surveillance-vendor="Highster Mobile"*

Table 17491. Table References

Links
https://www.bestphonespy.com/highster-mobile-review/

Mobile Spy

Mobile Spy is a cell phone monitoring application for iOS, Android and BlackBerry developed by Retina-X Studios. It allows you to monitor the smartphone activity of your children. You'll be able to see text messages, track GPS locations, monitor social media activities, view call details and more inside a secure online account. Monitoring made easy. Login anytime you wish from any location to see the recorded data without needing access to the monitored phone. The hidden version of Mobile Spy is no longer available due to legal issues.

The tag is: *misp-galaxy:surveillance-vendor="Mobile Spy"*

Table 17492. Table References

Links
https://www.bestphonespy.com/mobile-spy-review/

Hoverwatch

Hoverwatch is a computer and mobile monitoring software developed by Refog. It is available for Android, Windows and macOS. It runs silently in the background, recording all activities performed by the user such as messages sent and received, phone calls made and received, web sites visited, and every keystroke typed. All recorded data is sent to an online account.

The tag is: *misp-galaxy:surveillance-vendor="Hoverwatch"*

Table 17493. Table References

Links
https://www.bestphonespy.com/hoverwatch-review/

MobiStealth

MobiStealth is a popular spy software that comes with a simple web-based console and powerful monitoring features. It is developed by Infoweise Pty Ltd, a private company headquartered in Sydney, Australia. They have been making high quality monitoring solutions since 2009. In November 2015, they launched a “Non-Jailbreak” feature, letting users spy on all iOS devices without needing to jailbreak them. Just like many other spy software, MobiStealth allows you to spy on a cell phone or computer via a web interface called StealthClub. As its name implies, it is a stealth application that runs in the background without the owner’s knowledge.

The tag is: *misp-galaxy:surveillance-vendor="MobiStealth"*

Table 17494. Table References

Links
https://www.bestphonespy.com/mobistealth-review/

Spyera

Spyera develops and sells computer and mobile spy software. Based in Hong Kong, Spyera’s products work in all languages and all countries. The company’s phone and PC monitoring products are useful tools for any parent or company, although they are quite expensive in comparison to other products. Spyera comes in three different versions — a mobile version for iPhone and Android smartphones, a tablet version for iPad and Android tablets, and a desktop version for Mac and Windows. The mobile version of Spyera is actually very similar to the FlexiSPY Extreme, which I reviewed a few weeks ago. It has everything you’d expect from a cell phone spy software: live call listening, call recording, and location tracking.

The tag is: *misp-galaxy:surveillance-vendor="Spyera"*

Table 17495. Table References

Links
https://www.bestphonespy.com/spyera-review/

StealthGenie

StealthGenie is a powerful cell phone spy software created by InvoCode Ltd in 2010 that can be used to spy on cheating spouses and monitor children’s activities. In September 2014, Hammad Akbar, founder of StealthGenie, was arrested in Los Angeles and charged with selling mobile device spyware. StealthGenie was officially discontinued on 26 September 2014.

The tag is: *misp-galaxy:surveillance-vendor="StealthGenie"*

Table 17496. Table References

Links
https://www.bestphonespy.com/stealthgenie-review/

SpyBubble

SpyBubble is a spy app that lets you secretly spy on someone's phone. This spy app is compatible with a variety of mobile devices, including iPhone, Android, BlackBerry and Symbian, and it offers logging features for most cell phone activity. SpyBubble doesn't provide the blocking and restricting features that you will find in several similar applications. However, it has many useful features, and its monitoring features are excellent. Spybubble cell phone spy software was discontinued due to legal reasons

Cytrox

Cytrox's Israeli companies were founded in 2017 as Cytrox EMEA Ltd. and Cytrox Software Ltd. Perhaps taking a page from Candiru's corporate obfuscation playbook, both of those companies were renamed in 2019 to Balinese Ltd. and Peterbald Ltd., respectively. We also observed one entity in Hungary, Cytrox Holdings Zrt, which was also formed in 2017.

The tag is: *misp-galaxy:surveillance-vendor="Cytrox"*

Cytrox is also known as:

- Cytrox EMEA Ltd.
- Cytrox Software Ltd.
- Balinese Ltd.
- Peterbald Ltd.
- Cytrox Holdings Zrt

Innova

Innova, based in Trieste, Italy, and a frequent supplier of Italian prosecutor's offices. It was the only Italian firm at the International Exhibition for National Security and Resilience (ISNR), which was held in Abu Dhabi in October 2022. The exhibition connects regional government agencies with manufacturers from around the world, and was organised in cooperation with the Ministry of the Interior and in strategic partnership with Abu Dhabi Police GHQ. The United Arab Emirates, however, is known for human rights violations, some of which facilitated by the use of digital surveillance technology, as in the case of an iPhone spyware that was used against hundreds of activists, foreign leaders and suspected terrorists, according to Reuters. Innova's foreign presence did not stop at ISNR. The company was also at ISS World Latin America, which took place in Panama in October 2022, and was among the sponsors of the September event of ISS World Asia Pacific 2022 in Singapore. These trade shows are not mere opportunities for display, but allow direct contact with members of intelligence agencies from various countries, law enforcement officials and government leaders or ministers.

4Intelligence

4Intelligence AB is a manufacturer and provider of surveillance tools, produced primarily for intelligence agencies, law enforcement authorities, military units, and private security companies.

Their IMSI/IMEI catchers are designed to collect essential identifiers, such as IMSI (International Mobile Subscriber Identity) and IMEI (International Mobile Equipment Identity), from cellular devices operating on GSM, UMTS, LTE, and 5G networks. These systems are utilized for intelligence gathering and monitoring within the operational radius of the devices. In addition to IMSI catchers, the company offers a range of products, including RF detectors, WiFi monitoring, camouflaged video transmitters and recorders, vehicle geolocation systems, location based tracking and other interception technologies.

In addition to Sweden, the company also has offices in Cyprus and Dubai, UAE.

Aarogya Setu

Aarogya Setu is a mobile application developed by the Government of India in April 2020 to perform COVID-19 contact tracing. It pairs Bluetooth handshakes with periodic GPS pings to flag when users have been near someone who later tests positive, then offers risk scores and health guidance. Since the pandemic, the platform has been folded into the National Health App stack, adding vaccination certificates and other digital health services.

The app embeds far-reaching surveillance capabilities. On sign-up, it demands granular personal data, such as name, phone number, age, sex, profession, travel and even smoking history, which are transmitted to a central government server. Continuous collection of live location and proximity logs lets authorities recreate a user's movements and social graph, described by critics as a sophisticated surveillance system.

The tag is: *misp-galaxy:surveillance-vendor="Aarogya Setu"*

AASMA

The Advanced Application for Social Media Analytics (AASMA) is a social media surveillance tool developed by the Indraprastha Institute of Information Technology, Delhi, with funding from the Indian government. It is utilized by at least 40 government departments in India. AASMA can collect and analyze live data from platforms like Twitter, Facebook, and YouTube, perform sentiment analysis, track user locations and devices, and send alerts to authorities based on predefined criteria. It is employed for purposes such as monitoring public sentiment, handling protests, and identifying influential users.

Ability, Inc

Ability is a security firm based in Tel Aviv. The company develops and provides interception and

decryption communication tools to security and intelligence agencies, military forces, police and homeland security services.

Its surveillance capabilities include both passive and active interception of cellular communications across GSM, CDMA, UMTS, and LTE networks, as well as satellite communication interception for systems like Thuraya, Iridium, and VSAT. Ability also offers decryption tools to break encrypted communications and geolocation technologies for tracking cellular devices, and developed the Crosscan system, a portable IMSI catcher for tracking mobile devices. Its operations span across 50 countries worldwide.

Ability cooperated with NSO Group on Pegasus and handled the network side of NSO's operations.

```
In 2015, it merged with Cambridge Capital Acquisition Corporation (aka Cambridge.)
```

AccessData

AccessData Group was a U.S.-based cybersecurity company that developed digital forensics investigation technology. The company created the Forensic Toolkit (FTK), which became an industry-standard tool for extracting and analyzing data from digital devices. The technology was used by law enforcement agencies worldwide, including in Nigeria, where it was employed alongside other forensic tools for extracting information from seized devices.

AccessData's merger with Exterro created a powerful surveillance conglomerate. Their combined digital forensics and data extraction capabilities give law enforcement and government agencies unprecedented access to personal information, particularly given the company's two-decade history of developing tools that can crack passwords, decrypt files, and extract sensitive personal data from devices without user consent.

AccessData's Forensic Toolkit (FTK) was also used by Botswana's Police Service Digital Forensics Laboratory alongside Cellebrite's UFED to conduct invasive searches of journalists' devices. The technology was deployed in the case of Oratile Dikologang, a digital editor, where police "successfully extracted" and "thoroughly analyzed" thousands of messages, contacts, images, audio

files, videos, and social media accounts from his phone. When contacted by the Committee to Protect Journalists (CPJ) about this surveillance activity, AccessData and its parent company Exterro declined to respond to questions about their technology's use in Botswana's press freedom violations.

Acxiom

Acxiom is a data broker and marketing technology company headquartered in Conway, Arkansas. Known for its extensive data collection and analytics capabilities, Acxiom aggregates and processes vast amounts of personal information, including demographic details, purchasing behavior, online activity, real-time location, and more. This data is used to create detailed consumer profiles, which are then sold to a wide range of clients, including advertisers, marketers, financial institutions, government agencies and political organizations. In the U.S, the company has held contracts with the Central Intelligence Agency (CIA), the State Department and other federal government agencies.

In 2014, Acxiom acquired LiveRamp, integrating its services to enable cross-device tracking and data onboarding, which helps connect online and offline consumer data. This partnership allows Acxiom to extend its data reach, offering even more granular insights into consumer behavior and location data to a broader range of clients. In 2018, Acxiom claimed to have data on over 2.5 billion people in over 62 countries, including 68% of the global online population.

Almenta

Almenta is a surveillance firm based in Bulgaria and run by Israeli operators, including CEO Ari Covitz. It develops Wi-Fi-based hacking tools, which it showcased at the Milipol homeland security conference. The company offers a product called WiNA-P, which enables a variety of attacks on smartphones by exploiting Wi-Fi networks. These attacks include delivering malware to extract data from apps like WhatsApp, Telegram, Facebook, and Skype, as well as phishing capabilities to steal login credentials through fake landing pages. Almenta also advertises an "Account Grabber" feature to identify iCloud or Android accounts by sending deceptive messages to targets.

Alongside WiNA-P, Almenta promotes a product called “Observer,” which offers “worldwide geo location,” as described in a blurb on Milipol’s website. A brochure for “Observer” reveals that, with only a target’s mobile phone number, the device’s location can be pinpointed and displayed on a Google Maps interface.

The company claims its tools can operate from up to 500 meters away and target as many as 50 devices simultaneously. Almenta’s technology reportedly relies on tools from other Israeli surveillance firms, such as WiSpear and Jenovice, with costs for such systems starting at $1 million.

The tag is: *misp-galaxy:surveillance-vendor="Almenta"*

Amesys

Amesys is a French company known for the sale of a program called Cerebro, capable of tracking the electronic communications of its targets, including email addresses and phone numbers. In 2007, it reportedly sold surveillance technology to Libya, which was used by the Gaddafi regime to arrest and torture critics of the regime. Former managers of Amesys went on to run Nexa Technologies, which, in 2014, sold an interception system to the Egyptian regime under the name Eagle. The system was used in connection with the detention and torture of political opponents of the Al-Sissi regime. Eagle was deployed and maintained by Amesys from 2007 to 2011. In 2021, executives of Amesys and Nexa Technologies were indicted for complicity in torture.

The company rebranded to Advanced Middle East Systems and moved its operations to the United Arab Emirates.

The tag is: *misp-galaxy:surveillance-vendor="Amesys"*

Anomaly Six

Anomaly Six (A6) is a Virginia-based company founded in 2018 by two ex-military intelligence officers. The company claims to have the capability to track approximately 3 billion devices in real time through GPS data collected via smartphone apps. According to a report by The Intercept, their surveillance system operates by gathering location data through partnerships with "thousands" of apps using software development kits (SDKs). The company also claimed to have the capability to unmask and track intelligence agency (CIA and NSA) personnel during a pitch to Zignal Labs, a social media monitoring company. The company proposed a joint venture with Zignal Labs that would enable the U.S. government to conduct seamless surveillance operations on adversaries. Anomaly Six's capabilities are largely made possible through the advertising industry's data collection practices, highlighting the connection between commercial data brokers and surveillance techniques.

U.S. Special Operations Command (SOCOM) paid $589,500 to Anomaly Six in September 2020 for a "Commercial Telemetry Feed." The company's co-founder, Brendan Huff, previously managed Defense Department relationships of another U.S surveillance company called Babel Street.

Appin

Appin was an Indian hack-for-hire company founded in 2003 by brothers Rajat and Anuj Khare, and involved in extensive surveillance activities. Operating through various subsidiaries including Appin Software Security Pvt. Ltd. and the Appin Security Group, the company positioned itself as a cybersecurity solutions provider. While publicly presenting itself as the "world's 4th largest Critical Infrastructure Security Solutions Company", the company was reportedly involved in hack-for-hire activities, including espionage and targeted surveillance. The company served a wide range of clients, including Israeli private detectives Aviram Halevi and Tamir Mor, who alone commissioned surveillance operations on dozens of targets.

Appin has garnered attention for its aggressive legal campaign to suppress reporting about its past activities, most notably forcing Reuters to temporarily remove an investigative article through an Indian court order. The Association of Appin Training Centers, a successor organization, has pursued legal action against multiple media outlets to remove references to Appin's illegal hacking operations, though this effort has faced resistance from organizations like the Electronic Frontier

Foundation and DDoSecrets.

The company's influence persists through numerous successor organizations, with former Appin employees establishing and operating their own firms that continue similar surveillance and hacking operations.

AppLogic Networks

AppLogic Networks (formerly Sandvine) is a Canadian network intelligence company. A 2018 report by Citizen Lab found Sandvine DPI equipment being used in Turkey, Egypt, and elsewhere to block news, political sites, and inject spyware into downloads. In in 2020, Masaar conducted tests revealing that Sandvine equipment was used to block access to press and human rights websites in Egypt. In 2025, Amnesty International reported that Sandvine technology was central to Pakistan's first national firewall system (WMS 1.0), enabling mass surveillance and censorship of online communications.

AppsFlyer

AppsFlyer collects and processes data using software development kits (SDKs) integrated into apps, which track user behavior and device identifiers. The company built settings that let their clients ignore people's tracking preferences. AppsFlyer was noted to collect data such as Advertising IDs, GPS coordinates, user birthdays, gender, "target gender" (data on sexual orientation) and various metadata from apps like Tinder, Grindr, OkCupid, amongst many others, creating detailed user profiles and their activities.

Founded in Israel in 2011, the company also operates from an additional office in San Francisco, California.

Assac Networks

Assac Networks is an Israeli company that provides smartphone monitoring technologies. Its clients

include other companies engaged in surveillance activities, such as Elbit Systems, Verint, and Rafael Advanced Defense Systems Ltd. Their mobile surveillance technologies are used by law enforcement agencies in Mexico, Colombia, Canada, Spain, and Singapore, amongst other countries. The company was also awarded a government contract from one of the Gulf Cooperation Council countries, although it is not known which one, as well as in at least 3 countries in Africa. In 2022, the company announced a major strategic investment and acquisition by ASPIS Technologies, Inc.

Autel

Autel Robotics, a Chinese drone manufacturer, is a producer of drones with capabilities such as high-resolution cameras, precise surveillance tools, and the ability to carry out military functions like shooting or carrying payloads. Autel drones have been widely deployed in various conflict zones.

The Israeli Defense Forces (IDF) make extensive use of Autel drones. According to the Euro-Med Human Rights Monitor, while they were initially deployed for surveillance and intelligence gathering, including for indoor operations, their use later expanded to include direct attacks on Palestinian civilians, including children, women, and the elderly.

Autel drones are widely used by law enforcement agencies in the U.S, and have also been adopted by the British Army and UK police forces, including those in Nottinghamshire and Wiltshire. The company has a registered office in the UAE.

Avalanche

Avalanche, also known as Lavina-Pulse, is a Russian big data surveillance and online manipulation tool founded by Andrei Masalovich, a former KGB agent turned YouTube influencer. The platform provides web scraping and surveillance on behalf of its clients, gathering data from social networks, private groups, and niche forums to track and analyze individuals and organizations.

Avalanche's clients include Russian intelligence agencies (FSB and GRU), energy giants like Rosatom, Rosneft, and Gazprom, and regimes in countries such as Vietnam, Myanmar, and Nicaragua. The tool has been used to monitor environmental activists, journalists, NGOs, and political dissidents.

More than 100 accounts on Facebook and Instagram were linked to its services, according to a report by Meta.

Avathon

Avathon, formerly known as SparkCognition, markets its Visual AI Advisor as a tool for real-time surveillance and monitoring, using existing CCTV infrastructure to track, analyze and predict behavior.

SparkCognition has connections to controversial lobbying efforts, revealed in the scandal involving retired U.S General John Allen and his undisclosed financial ties to Qatar. Court filings revealed that Allen, while working with Qatari officials, sought to advance the interests of companies he was affiliated with, including SparkCognition. As a board member of SparkCognition, Allen reportedly used his position to promote the company's AI tools and services during his interactions with Qatari officials.

SparkCognition's Visual AI Advisor is deployed across over 130,000 cameras in 16 countries. The company's SkyGrid technology is installed in over 78,000 registered unmanned aerial vehicles (UAVs) across more than 190 countries.

Avigilon

Avigilon, a subsidiary of Motorola Solutions, specializes in the design, development, and manufacture of advanced surveillance solutions that integrate artificial intelligence (AI) capabilities. Their products include high-definition cameras, video management software, and AI-powered analytics tools. One of the company's developments is the Avigilon Appearance Search technology, an AI-powered tool embedded in their Avigilon Control Center (ACC) video management software. This technology allows customers to search for individuals based on specific physical characteristics, such as hair and clothing color, gender, and age, effectively turning surveillance systems into tools for profiling. Avigilon's cameras are used in prisons, airports, schools and government facilities.

Avnon Group

Avnon Group is an Israeli firm that develops and distributes surveillance technologies through various subsidiaries, such as Bler and Tactic Lab. It's founded by Tomer Avnon, a former Israeli Navy SEAL.

The company offers various tools for intelligence and law enforcement, like IMSI catchers and Wi-Fi sniffing equipment, to enable real-time mobile tracking and wireless communication interception. According to its official website, it operates in over 80 countries worldwide.

Avnon has established partnerships with various countries in the SWANA region, including Morocco and several Gulf nations. The company also has a significant relationship with Egypt, where its subsidiary Bler sold its monitoring tools, specifically its Webint Center platform, to Egypt's Technical Research Department through intermediaries.

Avnon sold social media-tracking software to Hungary, allowing the government to monitor online discourse and public opinion. The sale was approved by Israel's Defense Ministry.

Related to Avnon Group is Synaptech Capital, the first Israeli-Emirati venture capital fund to invest in Israeli and Emirati startups - including ones that develop and distribute surveillance technologies. Synaptech Capital was co-founded by Tomer Avnon and Obediah Ayton, COO of The Private Investment Group.

Azimuth Security

Azimuth Security is an Australian cybersecurity firm best known as a "hack for hire" group that creates hacking tools, including those capable of breaking into iPhones. The company has gained recognition for its "artisanal" approach to developing exploits to craft precise and effective solutions. Azimuth's work has been utilized by law enforcement and government agencies, often in high-profile cases requiring advanced technical capabilities. In 2018, it was acquired by U.S. defense contractor L3Harris.

Babel Street

Babel Street provides tools that analyzes and monitors social media and other online sources for law enforcement and intelligence purposes. Used by U.S Secret Service, it can scrape data from over 25 social media sites, translate over 200 languages, and set up geo-fences with customizable filtering options. The software can also survey sentiment geographically over time and import data to other surveillance platforms like Palantir.

One of its primary AI products, Babel X, is used by the U.S Customs and Border Protection (CBP) to analyze the social media of U.S. citizens, refugees, and asylum seekers. Babel X can link social media posts to individuals' Social Security numbers, location data, and collect a wide range of other identifiers, including IP addresses, employment history, and unique advertising identifiers. CBP also uses Locate X, an add-on that includes smartphone location data, and has access to AdID information. Locate X can zoom into a specific location and display the movements of smartphones in that area. Each phone, represented by a red dot on the map, can be tracked individually. The tool can show the path a specific device has taken, including stops at various locations.

Babel Street's acquisitions include intelligence company Vertical Knowledge in 2024, Rosette, a text analytics platform, in 2022, and Dunami, a social media intelligence company, in 2020. Its board of advisers includes Robert Ashley, ex-director of the Defense Intelligence Agency.

BadBazaar

BadBazaar is a mobile spyware tool with variants targeting both Android and iOS devices. It has been linked to Chinese-backed hacking groups, such as APT15. This group is known by various names assigned by different cybersecurity organizations, including Vixen Panda, Ke3chang, Nickel, Playful Taurus, BackdoorDiplomacy, Mirage, GREF, RoyalAPT, Nylon Typhoon, Flea, and Red Vulture.

BadBazaar has primarily been used to target Uyghur, Tibetan, and Taiwanese individuals, as well as civil society actors who may oppose Chinese state interests.

The spyware is distributed through trojanized apps, including fake versions of popular communication tools like Signal and Telegram, as well as apps tailored to specific communities, such as Uyghur-language Quran apps. Once installed, BadBazaar can collect sensitive data, including call logs, GPS locations, SMS messages, and files. The spyware has also been observed spreading via social media platforms and official app stores.

The Chengdu-based contractor, Sichuan Dianke Network Security Technology Co., Ltd. (also known as UPSEC), was linked to the deployment of this malware.

Balgh

The Balgh (□□□ - meaning "report" in Arabic) platform, launched by Iraq's Ministry of Interior in January 2023, is a digital tool designed to allow citizens to report social media content deemed to "violate public morals" or "undermine social stability." Within just over a month of its launch, the platform received over 96,000 reports, resulting in prosecutions and prison sentences for individuals accused of publishing content deemed critical or offensive, including creators of music and comedy.

In a statement co-signed by the nonprofit INSM for Digital Rights in Iraq on January 2025, marking two years since the launch of Balgh, human rights organizations highlighted how the platform has enabled a pervasive culture of widespread surveillance and fear online. It has encouraged individuals to monitor and report one another to the Iraqi authorities, leading to arrests and interrogations.

BeeSense

BeeSense is an Israeli company that develops multi-sensor systems and wireless communication technologies for intelligence gathering and surveillance purposes. Its systems, such as the BEE-3 and FireFly, provide day-and-night observation capabilities and are designed for applications like border control. BeeSense has been endorsed by the European Union's border agency, Frontex, which shortlisted the company for its surveillance solutions.

BeeSense is the rebranded name of Seraphim Optronics following its acquisition by the Avnon Group in July 2021.

The company's founder, Israel Kasher, who has served as President and CEO since its establishment in 1993, previously worked with a technical unit of the Israeli Defense Forces (IDF) Intelligence Corps.

BellTroX

BellTroX InfoTech Services is an Indian IT firm offered its hacking services to help clients spy on more than 10,000 email accounts over a period of seven years. A cache of data reviewed by Reuters provides insight into the operation, detailing tens of thousands of malicious messages designed to trick victims into giving up their passwords that were sent by BellTroX between 2013 and 2020. The data was supplied on condition of anonymity by online service providers used by the hackers after Reuters alerted the firms to unusual patterns of activity on their platforms. Citizen Lab revealed in an investgiation that Dark Basin is a hack-for-hire organization linked to BellTroX. Their report also noted that Dark Basin is the group behind the phishing of organizations working on net neutrality advocacy, uncovered by a report by the Electronic Frontier Foundation.

Berico Technologies

Berico Technologies provided analytics solutions and surveillance technologies for government clients, including social media analysis for intelligence purposes. Patrick Ryan, who worked at Berico as a data mining expert, was involved in a proposal aimed at implementing real-time surveillance of politically active individuals and groups in the USA. In partnership with Palantir Technologies and HBGary Federal, the proposal would have included spying on the families of prominent Democratic activists and planting fabricated documents within labor unions to undermine their credibility. Novetta, Inc., a portfolio company of The Carlyle Group, acquired Berico Technologies in November 2018 for an undisclosed sum. Novetta was then acquired by Accenture Federal in 2021.

Berla

Berla is a Maryland-based company that develops vehicle forensics products, with its primary tool, Project iVe, allowing law enforcement to extract and analyze vast amounts of data from vehicles. This includes vehicle-generated information such as GPS logs, door activity, and even data from connected devices like smartphones via Bluetooth or USB.

Berla collaborates with automobile manufacturers and the U.S. Department of Homeland Security (DHS), ensuring law enforcement has access to vehicle data while bypassing smartphone encryption. The company claims its technology can access data from over 6,700 car models globally.

BI Incorporated

BI Incorporated is a subsidiary of the GEO Group, a private prison company that operates more than a dozen for-profit immigrant detention centers nationwide on behalf of ICE (Immigration and Customs Enforcement) in the United States. BI Incorporated operates the technology and manages the system for the U.S. government’s Alternatives to Detention program. This program uses various surveillance tools to monitor migrants and asylum seekers awaiting their immigration proceedings. The surveillance technologies used in the Alternatives to Detention program include GPS-enabled ankle monitors, voice recognition technology, and a mobile app called SmartLINK that uses facial recognition software and geolocation for check-ins. The program’s surveillance creates "digital enclaves" - areas with high concentrations of monitored migrants, effectively extending the border’s reach into various U.S. cities and neighborhoods.

According to The Guardian, "BI Incorporated operates the Intensive Supervision Appearance Program (ISAP), a surveillance system launched in 2004 and pitched as a way to keep immigrants out of detention centers while they await a court hearing on their legal status. The U.S government pays BI hundreds of millions of dollars a year to run ISAP, and in 2020, the company signed a new five-year contract with ICE for nearly $2.2 billion."

The company is expanding its surveillance toolkit. In April, 2023, ICE announced it was pilot testing a facial recognition smartwatch as a potential addition to their e-monitoring systems. In 2025, it was revealed that ICE intends to expand its surveillance program by fitting over 180,000 immigrants with ankle monitors (and wrist trackers for pregnant women) while they await court proceedings. These devices are supplied and managed by BI Incorporated.

BI2 Technologies

BI2 Technologies is a developer of biometric identification systems. Their main product is called I.R.I.S., which scans a person's iris to quickly check their identity. They also have a mobile system called MORIS that can capture iris and facial data using a smartphone or tablet, allowing law enforcement to identify people in the field.

In October 2025, an article in the Washington Post revealed that the company is a contractor for U.S. Immigration and Customs Enforcement (ICE). ICE awarded the company a sole-source contract worth $4.6 million to provide a mobile iris-scanning system for use by its agents. Border sheriffs along the U.S.-Mexico border have also adopted the company's iris-recognition technology.

BigBear.ai

BigBear.ai is a provider of AI-powered decision intelligence solutions, including predictive analytics, computer vision, and event alerting technologies. Their products utilize AI and machine learning to provide surveillance capabilities. The company actively collaborates with government agencies, including the Department of Defense (DoD), Department of Homeland Security (DHS), and the Intelligence Community (IC). BigBear.ai's surveillance capabilities include monitoring and analyzing social media as part of its Virtual Anticipation Network (VANE).

In 2024, BigBear.ai acquired Pangiam, a company that provides surveillance tools including facial recognition systems for border control agencies.

Bilgi Teknoloji Tasarım

Bilgi Teknoloji Tasarım (BTT) is a Turkish spyware manufacturer that also facilitates surveillance technology sales, often employing deceptive practices to bypass export restrictions. According to an Al Jazeera investigation, BTT's co-founder, Alper Tosun, proposed using the "dual-use" ruse to market surveillance equipment as benign telecom tools. This tactic allowed BTT to sidestep international regulations and sell powerful interception tools, such as IMSI-catchers, to repressive regimes.

BTT's controversial history includes its exposure in the 2015 Hacking Team leaks, which revealed its intermediary role in supplying surveillance software to Bangladesh's National Telecommunication Monitoring Centre (NTMC). Following these revelations, BTT underwent significant transformations. It was acquired in 2017 by the Emirati firm B Research and Development but later ceased operations. However, its spyware and surveillance activities continued through corporate rebranding and restructuring.

In 2022, BTT reemerged as Ikon Arge Teknoloji, a Turkish-Singaporean entity with ties to Southeast

Asia. Ikon inherited BTT's expertise and staff, including its former R&D chief Alper Tosun, before his "retirement." Officially, Ikon focuses on software R&D, including drone technology, and serves Turkish government agencies like TUBITAK while maintaining a presence in Southeast Asia through its Singapore branch. Despite its claims of working in sectors like banking, Ikon's history and connections suggest a continued involvement in surveillance technologies. Lam Chee Loong is a key figure in BTT's Singapore operations.

Black Cube

Black Cube is a private intelligence agency based in Israel that provides intelligence and investigative services to a wide range of clients. The agency was founded by former Israeli intelligence officers, with offices in London and Madrid. Black Cube is known for conducting corporate espionage, intelligence gathering, and investigations on behalf of corporations, governments, and high-profile individuals worldwide. Its clients include Harvey Weinstein and Trump. It was banned by Meta for its surveillance activities on its platforms. Its international advisory board included Meir Dagan, former head of Mossad, and Yohanan Danino, former Israeli Police Commissioner, as well as Major General Giora Eiland, former head of the Israeli National Security Council, and who headed the IDF's Operation Branch. Former NSO CEO Shalev Hulio admitted to hiring Black Cube at in at least one situation in Cyprus.

Blackdot Solutions

Blackdot Solutions, a Cambridge-based company, offers a surveillance and investigation platform called Videris, which is marketed as an open-source intelligence (OSINT) tool. Videris is designed to help government agencies, law enforcement, banks, and corporations conduct discreet investigations into crimes. It organizes publicly available information into charts and graphs for easier analysis. However, a leaked 2018 user manual revealed that Blackdot provided instructions on creating fake Facebook and LinkedIn accounts to gather data from users, including circumventing privacy settings. These practices, which involve using proxy servers and "breaking in" fake accounts by mimicking normal user behavior, were detailed to avoid detection by social media platforms.

Bler

Bler is an Israeli company founded by Efim Lerner and Uri Boros. It develops a range of surveillance tools, such as a GTM platform designed for in-depth analysis of social media profiles and interactions. Bler's Webint Center platform provides capabilities such as the geolocation of targets through social media metadata, avatar management systems, and Dark Web monitoring extensions. This platform was supplied to Egypt's Technical Research Department (TRD) via Singapore-based CloudCode and Ukrainian partner Cyberio.

Bler also developed an interception and social network monitoring system and utilizes IMSI catchers in its operations. This system, when associated with an IMSI catcher or a WiFi interceptor, can reconstruct the profile of smartphone users within a 600-meter radius.

The company operates as a subsidiary of Avnon Group.

Blighter Surveillance Systems

Blighter Surveillance Systems develops electronic-scanning (e-scan) radar and surveillance technologies for border control and military applications. Their products include the B422 LR Border Surveillance System, which offers 360° e-scan coverage and long-range detection of individuals up to 15 km, and the Lightweight Mobile E-Scan Radar. These systems are accompanied by software solutions like the C2 Radar Command & Control Software, which integrates radar data for advanced target tracking. Their surveillance technologies are deployed in over 35 countries, often sold through subsidiaries.

Blighter also has a strategic partnership with Trust International Group (TIG), a key player in the UAE's defense and intelligence sector under the Royal Group, led by Tahnoon bin Zayed, the son of Zayed bin Sultan Al Nahyan (the founder of the UAE), and who has served as the country's National Security Advisor since 2016.

Blue Ocean

Blue Ocean is an offensive cyber firm headquartered in Singapore and with offices in Tel Aviv, Israel. The company, founded in 2017 by retired Brigadier General Rami Ben-Ephraim and Lieutenant Colonel Ron Tira, both former high-ranking Israeli Air Force officers, develops spyware for intelligence gathering. It is also involved in training and developing local surveillance expertise in the funding countries. Towards the end of his military service, Ben-Afriam served as a military attaché for the IDF and the Ministry of Defense in several countries in the Asia-Pacific region, including Singapore, Thailand, and New Zealand.

Singapore’s Ministry of Defense has contracted Blue Ocean to supply a team of researchers, a role previously filled by Israeli spyware developer Candiru, while Sweden has become the firm’s primary European client, according to Intelligence Online.

The company's CEO, Avi Rosen, was previously the former CEO of Kamira, a cyber company established by NSO founders Shalev Hulio and Omri Lavie. Retired General Giora Eiland, known for his role on the board of private investigation firm Black Cube (whose clients include Harvey Weinstein and Trump), serves on Blue Ocean's board.

The company has special security approval, giving it economic immunity. Unlike other Israeli spyware firms facing export controls and U.S. restrictions, it has secured significant investments and operates internationally with less scrutiny.

Bluehawk CI

Bluehawk CI is an Israel-based firm that reportedly offers a range of cyber intelligence and surveillance tools and services, including spyware and hacking tools. Like similar firms, Bluehawk CI markets its services to government agencies, law enforcement, and intelligence organizations. According to the Daily Beast, the company was founded by Guy Klisman, a former Israeli military intelligence officer, and describes itself as an intelligence firm staffed by "alumni from special units in the Israeli intelligence community." The firm was used to dig up information on people with lawsuits against the emirate of Ras Al Khaimah in the UAE.

The tag is: *misp-galaxy:surveillance-vendor="Bluehawk CI"*

Boldend

Boldend, founded in 2017 by Jon Miller and based in San Diego, is a cybersecurity startup. It stays out of the spotlight and calls itself a "SaaS Next-Generation Defense Contractor." The company creates tools for cyber warfare, with an emphasis on automation and advanced intelligence activities. Boldend's tools have reportedly been able to exploit WhatsApp's security to install malicious software on target devices.

Its products include Origen, described as an "all-in-one malware platform" that enables the creation of malware for multiple platforms, including Windows, Linux, Mac, and Android. It is designed to hack into devices and extract data. Additionally, Boldend has developed other tools and platforms for surveillance purposes, such as Kevlar (implant analysis), Hedgemaze (traffic obfuscation), and Cricket (Wi-Fi attack hardware).

Boldend has primarily worked with government entities, including various branches of the U.S. government. In August, 2024, it was acquired by SIXGEN, a cybersecurity company.

Booz Allen Hamilton

Booz Allen Hamilton is an American management and IT consulting firm with extensive ties to U.S. intelligence, defense, and homeland security agencies, providing strategic and technological support to government operations, including for surveillance purposes. The company offers data analytics, cybersecurity, and AI-powered monitoring tools, enabling real-time tracking, risk assessment, and predictive modeling.

Booz Allen has provided services to U.S. Immigration and Customs Enforcement (ICE), including technical support for surveillance programs targeting immigrants and border activities. These contracts have included work on biometric data systems, information-sharing platforms, and analytics tools that support ICE's enforcement and deportation operations.

BriefCam

BriefCam is a leading provider of Video Content Analytics (VCA) solutions, using artificial intelligence and machine learning to extract detailed insights from video surveillance footage. Their technology enables customers to rapidly review, search, and analyze hours of video in minutes, identifying objects, events, and patterns with high precision. BriefCam's capabilities include real-time alerting, multi-camera search, and video summarization. BriefCam's technology is primarily used by law enforcement and government agencies, as well as for "smart city" initiatives. In 2018, Canon completed its acquisition of BriefCam. The company's partners include other surveillance entities such as Cognyte, Axis Communications, Pelco and IndigoVision.

Butterfly Effect

Butterfly Effect, a spin-off from the Kazakh tech group Kazdream, specializes in telephone interception and open-source intelligence (OSINT) tools. The firm is actively expanding its international presence, establishing a representation bureau in Dubai to target public sector contracts in the Middle East. To facilitate this, its chief commercial officer, Rinata Ilyubayeva, has been engaging with major regional players like the UAE's surveillance powerhouse Group 42 (G42) and Edge Group's subsidiaries, Sign4l and Beacon Red, at events such as the Gulf Information Technology Exhibition (GITEX).

In 2022, it launched a new intercepted data analytics platform named Triton, designed to complement its existing telephone interception and open-source intelligence systems.

Butterfly Effect's offerings also include advanced cyber tools such as "Artemida," a law enforcement platform designed for mass location and behavioral analysis.

C3 AI

C3 AI, founded by billionaire Tom Siebel, develops law enforcement surveillance technologies distributed through Project Sherlock, a $12 million AI-powered surveillance system developed for the San Mateo County Sheriff's Office. The project was designed to unify data streams from at least 15-16 different police agencies, integrating information from license plate readers, surveillance cameras, and arrest records into a single AI-powered application. The system has been plagued by technical problems, including data security issues where the software was found to be ingesting "restricted cases" that should only have been visible to select individuals.

Despite these local law enforcement struggles, C3 AI has secured significantly larger government contracts, most notably a five-year, $500 million agreement with the U.S. Department of Defense.

It counts Amazon Web Service as a longtime partner, and also works closely with Google Cloud.

Callyo

Founded in 2009 by Chris Bennet, Callyo is a Florida-based provider of surveillance tools for U.S. federal and law enforcement agencies. The company's tools enable tracking of locations, interception of calls, and turning smartphones into covert recording devices - all without the user's knowledge. One of Callyo's unique features is its ability to facilitate international wiretapping without requiring authorization from local authorities. By intercepting calls and routing them through virtual numbers to its servers, the software ensures that investigators can listen to and record conversations undetected. In Massachusetts, the Boston Police Department and State Police have faced scrutiny for using Callyo's app without obtaining proper warrants. An internal audit revealed that Massachusetts State Police had used the app in at least 250 cases without proper disclosure.

The company was acquired by Motorola Solutions in 2020.

CalypsoAI

CalypsoAI, founded by Neil Serebryany, Davey Gibian, and Victor Ardulov, is a developer of AI surveillance and security technology, including the VESPR platform, designed for national security applications. Backed by investors like Hakluyt Capital, CalypsoAI has established itself as an intelligence partner for U.S. government agencies, including the Department of Defense, the Department of Homeland Security, and the U.S. Air Force. In late 2023, the company joined Palantir's FedStart program, which supports the deployment of advanced AI technologies for U.S. government operations.

Camerite Sistemas

Camerite Sistemas S.A., headquartered in Joinville, Brazil, is a pioneering cloud-based video surveillance company founded in 2012 by Cristian Aquino. Camerite's suite of products include a

platform and mobile apps (iOS/Android) featuring AI-enabled video analytics, such as facial recognition, license plate reading (LPR/OCR), object detection, heat maps, and advanced search filters.

Camerite has executed significant city-level surveillance projects. In Naviraí, Mato Grosso do Sul, the company installed 100 cameras, including plate readers and 24/7 monitoring terminals, integrated with a cloud-based platform accessible to law enforcement agencies for realtime viewing.

Candiru

Israeli firm Candiru was founded in 2015 by Eran Shorer and Yaakov Weizman. According to Haaretz, the largest shareholder in Isaac Zack, who has been its chairman since the beginning and was also a founding funder of NSO. In 2021, malware manufactured by Candiru was found on the phones of politicians, journalists, and scholars in Iran, Yemen, Israel, the United Kingdom, and Turkey. Candiru has changed names multiple times, to Grindavik, then DF Associates, then Taveta, then Saito Tech, but it is still commonly known as Candiru. Founded in 2014, is thought to be Israel's second-largest spyware maker after NSO. With funding from NSO investors as well as the government of Qatar, its systems have been found to have been operated by multiple countries, including Saudi Arabia, Israel, UAE, Hungary, Indonesia, and Uzbekistan. In November 2021, the US Commerce Department added Candiru and NSO to its trade blacklist.

Researchers from Recorded Future's Insikt Group have identified active infrastructure associated with Candiru's spyware, known as DevilsTongue, in Hungary and Saudi Arabia. This spyware targets Windows systems and is believed to be deployed through spear-phishing emails, malicious links, and compromised websites.

In 2025, Integrity Partners, a U.S. investment firm, acquired Candiru's assets for up to $30 million, moving its operations and staff to the new entity Integrity Labs Ltd., which is not subject to U.S. sanctions. The deal aims to bypass U.S. restrictions after Candiru was blacklisted in 2021 over national security concerns.

Carbyne

Carbyne is a company headquartered in New York, with offices in Israel and Mexico. Founded by Amir Elichai, a former security guard for the Israeli consul general, Carbyne has its roots in Israeli intelligence, with ties to Unit 8200, a division known for its expertise in surveillance operations. Unit 8200 has been criticized for its surveillance activities, which include monitoring Palestinian civilians for coercive purposes and conducting surveillance on Palestinian-Americans through an intelligence-sharing arrangement with the NSA.

Carbyne's platform, marketed as an enhancement for emergency response, allows for extensive data collection from mobile devices and IoT sensors without explicit user consent. When a 911 call is made, Carbyne can automatically access the caller's precise location and video feed from their smartphone, effectively turning personal devices into surveillance tools. This capability is

expanded through partnerships with major tech companies like Cisco, enabling the collection of data from smart city infrastructure, such as road cameras and streetlamps, often without the public's awareness.

The company's advisory board includes notable figures such as former U.S. Secretary of Homeland Security Michael Chertoff and former Israeli Prime Minister Ehud Barak, furthering its deep ties to both the U.S. and Israeli security establishments.

The tag is: *misp-galaxy:surveillance-vendor="Carbyne"*

ChapsVision

ChapsVision is a technology company specializing in data processing, with a strong focus on surveillance solutions. It integrates advanced video analysis and artificial intelligence to deliver what it calls "intelligent video surveillance systems." These systems are designed for various applications, including automated tracking of individuals or objects using pan-tilt-zoom (PTZ) cameras.

Through its ACIC division, ChapsVision customizes solutions for surveillance, public monitoring, and people counting, utilizing a network of cameras and image analysis to automate such monitoring tasks. Through AI-augmented tools, the company also offers an integrated suite of solutions designed to access, gather, monitor, and analyze information from diverse global sources.

Circinus

Circinus is a defense and intelligence contractor that provided social media monitoring and intelligence for the UAE. Acquired by U.S Republican fundraiser Elliott Broidy from former US Army intelligence officer Alan Stone in 2014, Circinus operated a $200 million contract with the UAE's armed forces. It also maintains contracts with the US Army Intelligence and Security Command (INSCOM) and US Special Operations Command (USSOCOM).

Circinus has marketed surveillance and data-mining tools to various government agencies, including in Cyprus, Tunisia, Romania, and the UAE, with pitch documents touting capabilities like identity resolution and social media geolocation.

Former Circinus executives, including ex-CIA officers, have capitalized on the company's connections to establish new surveillance and intelligence ventures. Keith Noble, a former Circinus director, now runs BlackCloud International, which markets OSINT tools to governments, including contracts in the UAE and Eastern Europe. Similarly, Nick Williams, another former executive, has launched WMi General Trading in Abu Dhabi.

Clearview AI

Using a growing database of over 30 billion images scraped from social media and other online platforms, Clearview AI provides law enforcement and private entities with the ability to identify individuals through facial recognition software. This technology was also used by U.S federal agencies, including ICE and the FBI, to surveil immigrants, activists, and protesters, often targeting leftist groups and individuals critical of political figures. According to 404 Media, Clearview reportedly attempted to purchase Social Security numbers and mugshots from all 50 states in the U.S to expand its database. In 2025, ICE awarded the disputed facial recognition firm its largest government contract yet amid its ongoing crackdown targeting immigrants.

CloudWalk Technology

CloudWalk Technology is an AI company that has developed facial recognition software designed to track and surveil members of ethnic minority groups, including Tibetans and Uyghurs, and alert authorities if too many individuals gather in specific locations. Cloudwalk's surveillance technology is also used outside of China. In 2018, Cloudwalk and the Zimbabwean government agreed to the installment of a mass surveillance network in Zimbabwe. The agreement included a requirement that the Zimbabwean government send images it acquires from the surveillance network back to Cloudwalk's offices in China, so that Cloudwalk could improve the ability of its facial recognition software to recognize individuals based on skin pigmentation.

Cobham

Cobham is a provider of border monitoring and intelligence gathering technologies. The company develops advanced tools for audio, video, and IP transmission, as well as tagging, tracking, and locating systems, which are used for real-time surveillance and data collection.

Its Special Mission division provides airborne border surveillance, including contracts with the Australian government for maritime and border monitoring. Cobham also develops covert and overt surveillance systems, such as COFDM IP Mesh solutions and non-line-of-sight video surveillance. Cobham's systems are integrated into vehicles, allowing for covert and overt surveillance by law enforcement agencies and military operations.

Cobwebs Technologies

Cobwebs Technologies is an Israeli company whose surveillance software collects data from phones and social media activity, converting it into intelligence. The Los Angeles Police Department is amongst its users. Cobwebs has secured contracts with several U.S federal agencies, including U.S. Immigration and Customs Enforcement (ICE) through its Delaware-based branch, Cobwebs America Inc. In 2023, Cobwebs was acquired by PenLink through the support of private equity firm Spire Capital, a year after PenLink had also acquired another surveillance company, GeoTime.

Cognitec Systems

Cognitec Systems is a face recognition technology company. One of its products, FaceVACS, delivers extensive surveillance functionality that goes beyond basic face matching. The system can guess ethnicity based on a person’s skin color, flag suspects on watch lists, estimate the age of a person, detect gender, and "track" faces in real time. According to the company, it also helps identify

suspects if they have tried to evade detection by putting on glasses, growing a beard, or changing their hairstyle. It is used at border checkpoints in several countries, including Germany.

The New South Wales Police Force in Australia stopped using the company's PhotoTrac Suspect Identification System after concerns about the program's ineffectiveness and a tendency for "producing false identification matches when it comes to racial minorities in particular."

The company was acquired by SALTO Group in March, 2022.

Cognyte

Cognyte Software Ltd is an Israeli company that develops analytics software and is known to be a notorious surveillance vendor. Cognyte, currently located in Herzliya, Israel, shares an address with Verint and now provides cyberintelligence services similar to those previously offered by Verint. An investigation by Haaretz uncovered that Cognyte's mass surveillance technology has been sold to Myanmar in recent years. Its software was also unlawfully utilized by Brazil's intelligence agency to monitor and intimidate prominent politicians, journalists, judges, and environmental officials in the country during Jair Bolsonaro's far-right administration. In 2022, Cognyte sold a portion of their intelligence analytics software to the Volaris Group, a Canadian private equity firm, for US $47.5 million.

The company also brought on Nadav Argaman, the former director of Israel's internal security service Shin Bet, as a strategic senior advisor to continue developing closer ties to Israel's intelligence establishment.

The tag is: *misp-galaxy:surveillance-vendor="Cognyte"*

Complementics

Complementics is a data broker that captures mobile location data, extracting detailed insights from apps installed on users' smartphones. According to a report by VICE, Complementics collected location data from mobile applications and funneled it to firms like Venntel, which in turn sold this data to U.S. government agencies including ICE, DHS, and the FBI. This allowed federal agencies to circumvent warrant requirements and track people's movements via commercial data streams.

ComsTrac

ComsTrac Limited is a developer of surveillance and interception technologies, including IMSI catchers for GSM/UMTS/LTE networks, passive and hybrid GSM interceptors, and related tools that enable cellular monitoring and tracking. Their official website also markets the Mosaic OSINT suite for "monitoring and manipulating social media" and other online platforms, RF direction-finding systems, and surveillance systems integrated with drones. More specifically, their website boasts of the ability to develop "Trojans and Hacks to invisibly attack targeted iOS, Android and Blackberry handsets plus all Windows format and Mac OS computers. All social media apps such as WhatsApp, Viber, Line and Telegram can be intercepted and read along with all internet browsers, emails and cellular voice and messaging transmissions."

ComsTrac is listed among the UK companies authorized to export telecommunications interception technology, including IMSI catchers, to various countries, including those with abysmal human rights records. The company has a subsidiary named Comstrac FZE operated out of Ajman, the United Arab Emirates.

Converus

Converus, a private company specializing in lie detection technologies, has developed a product called EyeDetect, which uses eye-tracking technology to assess truthfulness. This tool analyzes subtle changes in eye movement and pupil dilation to predict deception. Converus pitched EyeDetect to the CIA in 2022 for its potential application in border control and migration management. in 2023, Converus launched VerifEye, a smartphone app that extends this technology to mobile devices, enabling self-administered truth verification tests.

Converus's technologies have reportedly been adopted by over 600 clients in 50+ countries, including law enforcement agencies.

Coralco Tech

Coralco Tech, an Israeli-Cypriot cyber-intelligence firm founded in 2016 by former U-TX Technologies employee Eyal Almog, is a provider of surveillance and cyber-intelligence solutions. Based in Limassol, Coralco offers a wide range of products, including open-source intelligence (OSINT) tools and interception technologies for LTE, GSM, WiFi, and other communication platforms.

The company has been linked to controversial activities, including the development of tools with similarities to malware from Wolf Intelligence, such as the WolfRAT, which targeted messaging apps like WhatsApp and Facebook Messenger. A command and control panel named Coralco Archimedes, identified in a Cisco Talos report, further suggested ties between Coralco and Wolf Intelligence, though the companies have since parted ways.

Coralco has also been involved in international deals, such as using its Singaporean branch to sell phone interception systems to the Bangladesh armed forces, with equipment shipped via Cyprus.

Corsight AI

Corsight AI is a facial recognition technology company headquartered in Israel with operations worldwide. The company specializes in developing facial recognition and surveillance technology powered by what they call "Autonomous AI," which, according to the company, is based on 15 years

of neuroscience research and over 250 patents. Their technology is designed to mimic human facial recognition capabilities.

Corsight's technology allegedly identify individuals even when less than 50% of their face is visible. It also provides real-time alerts and video analysis and claims to identify people wearing masks. More recently, it was developing technology to create facial models from DNA.

Israel implemented a mass facial recognition program in the Gaza Strip using Corsight AI's technology. The system was deployed at military checkpoints along major evacuation routes where Palestinians were fleeing southward, creating an extensive database of Palestinian civilians without their knowledge or consent. The technology faced notable accuracy challenges, particularly when processing grainy footage or partially obscured faces. One significant case highlighting these accuracy issues involved Palestinian poet Mosab Abu Toha, who was wrongfully detained at a checkpoint in mid-November while attempting to leave Gaza for Egypt with his family. After being flagged by the system as a wanted person, he was held in detention for two days, during which he endured beating and interrogation, before being released back to Gaza without explanation.

According to Gizmodo, in 2024 Corsight AI introduced a new surveillance system that monitors "sweethearting" - a practice where retail employees give unauthorized discounts to people they know - by analyzing customer-employee interactions, including physical proximity and visit patterns. The technology, which has already been implemented by unnamed clients, tracks whether customers consistently visit the same employees and triggers security alerts for suspicious patterns.

Corsight also announced a partnership with the public school system in Alagoas, a state in Northeastern Brazil, to implement its facial recognition technology in schools. However, the contract raised transparency concerns: while Alagoas had an active agreement with Teltex, a company acting as Corsight's reseller in Brazil, the contract made no mention of Corsight or the facial recognition solution. This practice violates local laws.

COSEINC

Founded by former Cyber Security Agency (CSA) official Thomas Lim, the Computer Security Initiative Consultancy (COSEINC) is a Singapore-based cybersecurity firm with extensive spyware and surveillance operations. In November 2021, it was blacklisting by the U.S. Department of Commerce, which cited the company's misuse of cyber tools to gain unauthorized access to information systems. Lim is known for organizing the SyScan security conference, which was sold

to the Chinese technology firm Qihoo 360, another sanctioned entity by the U.S.

Lim also operates Pwnzen Technology, a Singaporean subsidiary of China's Shanghai Ben Zhong Information Technology (Pwnzen InfoTech). Founded in 2014 by Chinese hackers associated with the Pangu Team, Pwnzen specializes in cyber monitoring and defense on behalf of China's government. The company collaborates closely with Chinese cyber institutions like CNCERT and CNNVD, which is linked to China's Ministry of State Security. Pwnzen is involved in hacking the phone of a Chinese opposition figure to access their social media accounts.

Crimson Hexagon

Crimson Hexagon, a Boston-based social media analytics firm, specializes in using artificial intelligence to analyze vast amounts of public social media data, providing insights for clients ranging from corporations like Adidas to government agencies such as the U.S. State Department. Founded in 2007 by Harvard professor Gary King and Candace Fleming, the company has built a repository of over a trillion public social media posts from platforms like Facebook, Instagram, and Twitter (now X). However, it has faced scrutiny over potential misuse of data for surveillance purposes, particularly in contracts with entities like the U.S. government, the Turkish government, and a Russian nonprofit linked to the Kremlin.

Crimson Hexagon became known as Brandwatch after a merger in 2018, and was later acquired by Cision for $450 million.

CrowdOptic

CrowdOptic is a vision analytics company specializing in advanced triangulation technology that integrates with realtime video systems to improve surveillance and facial recognition. Their products enable the use of fixed cameras, body cams, smartphones, and drones to identify individuals and targets in realtime.

In partnership with NEC Australia, CrowdOptic has developed advanced surveillance technology for smart cities. In collaboration, the companies built a system which allows cameras equipped with CrowdOptic software to stream video to servers running NEC's facial recognition software,

enabling the automated monitoring and analysis of public spaces.

According to Jon Fisher, founder of CrowdOptic, police in China are using CrowdOptic's technology to read license plates and "identify incidents" more efficiently. The system can instantly track when multiple police officers focus on the same object, providing faster results compared to manually sifting through surveillance camera footage.

The tag is: *misp-galaxy:surveillance-vendor="CrowdOptic"*

CSRA Inc

CSRA Inc. (formerly SRA International) is a subsidiary of General Dynamics that played a significant role in the U.S. government's immigration surveillance efforts. The company secured major contracts with the Department of Homeland Security (DHS) to operate the Visa Lifecycle Vetting Initiative (VLVI) program. Under these contracts, which ran from August 2018 through August 2023, CSRA was paid $42.1 million initially, with the total contract value ultimately reaching $101 million. The company's work involved analyzing and exploiting publicly available information, including media blogs, public hearings, conferences, and academic websites, using automated systems to monitor immigrants' social media and online presence.

The tag is: *misp-galaxy:surveillance-vendor="CSRA Inc"*

Cuebiq

Cuebiq is a location intelligence and data analytics company that collects and analyzes mobility data. The company gathers data through its proprietary software development kit (SDK), which is integrated into mobile apps. This SDK collects first-party location data from users, enabling Cuebiq to track and analyze real-world behaviors at scale. In return, some app developers share detailed location data with Cuebiq for analysis.

A proposed class-action lawsuit named Cuebiq among data brokers that bought location data from the family tracking app Life360 without users' knowledge or consent.

The tag is: *misp-galaxy:surveillance-vendor="Cuebiq"*

Cyberglobes

Cyberglobes, an Israeli open-source intelligence (OSINT) firm, has established itself as a prominent exporter of intelligence solutions despite facing bans from platforms like Facebook due to its spying

activities. Led by Pinhas (aka Pini) Kleiner, the company has been expanding its global footprint, recently showcasing its social network monitoring tools at the Digipol policing and defense fair in Hyderabad, India. Cyberglobes has a history in the Indian market, having demonstrated its solutions to Indian police forces as early as 2019. It has also been pitching its social network surveillance technologies to the United Arab Emirates.

The tag is: *misp-galaxy:surveillance-vendor="Cyberglobes"*

Dahua Technology

Dahua Technology is one of China’s biggest surveillance equipment makers. In February 2024, Dahua announced that it will establish a joint venture with Alat, a newly formed entity owned by Saudi Arabia’s Public Investment Fund (PIF), to manufacture surveillance hardware in Saudi Arabia. The company’s technology has been linked to the abuse of China’s Uighur minority and its

surveillance systems has also been deployed in the U.S, Vietnam, Mexico, UK and Brazil. Dahua confirmed it sells “skin color” analytics and defended them as “a basic feature of a smart security solution.”

A Reuters report revealed that Myanmar’s military junta is installing Chinese-built facial recognition cameras in key urban centers to strengthen its surveillance capabilities, with technology provided by Dahua alongside other Chinese surveillance giants, Hikvision and Huawei Technologies Co Ltd.

The tag is: *misp-galaxy:surveillance-vendor="Dahua Technology"*

Danaide

Danaide S.A. is a Buenos Aires–based technology firm that supplies UltraIP, the facial-recognition

platform that powers the city's Fugitive Facial Recognition System (SNRP), which was installed in 2019.

Independent investigations point to a close technical tie with Russia's NTechLab: UltraIP appears in the partners section of NTechLab's Russian-language website, and multiple reports note that the system "reportedly" runs on NTechLab's Find Face engine.

Danaide markets UltraIP as "analytics of our own design" on its corporate site, but the unresolved provenance has intensified legal challenges and human rights concerns after documented cases of wrongful arrests and the surveillance of activists.

The tag is: *misp-galaxy:surveillance-vendor="Danaide"*

Dassault

Arms giant Dassault Systèmes, a strategic partner of Thales, sold a mass surveillance system to Egypt in collaboration with Nexa Technologies. In 2017, Ahmed Alaa, a student in Egypt, was imprisoned for 80 days after being accused of posting a photo under a rainbow flag on social media. His arrest was facilitated by a mass surveillance system sold to the Egyptian government by French companies Nexa Technologies, Ercom-Suneris (a subsidiary of Thales), and Dassault Systèmes. This system, which includes internet surveillance software "Cerebro" and phone tapping device "Cortex vortex," allowed the regime to monitor and arrest its opponents.

Data Grand

Data Grand is a Chinese technology startup that has been linked to the development and deployment of censorship and surveillance tools utilized by Chinese authorities. The company was supported by Microsoft's startup incubator program, which provided resources and mentorship to emerging tech companies.

According to reports, Data Grand has been involved in creating software that automates the censorship of online content and assists in monitoring and analyzing digital communications. These tools are reportedly used by Chinese law enforcement agencies to suppress dissent and monitor the activities of individuals, particularly in regions with significant ethnic minority populations.

The tag is: *misp-galaxy:surveillance-vendor="Data Grand"*

DataWorks Plus

DataWorks Plus is a South Carolina-based company that provides advanced surveillance technology, equipping police with the ability to identify faces from surveillance footage in real time. One of their flagship products, FaceWatch Plus, offers "continuous screening and monitoring of live video streams," as described on the company's website. This technology was adopted by law enforcement agencies in cities like Chicago and Detroit, enabling real-time identification from live video feeds. Another one of their products, FaceCompare Plus, offers standalone morphological facial comparison, allowing agencies to compare two facial images side-by-side without a full facial recognition system.

The use of DataWorks Plus' technology has raised significant concerns, particularly regarding its reliability and potential for racial bias. In Detroit, the police department's use of this facial recognition technology has been criticized for its almost exclusive application against Black people in 2020. The department's own data revealed that the technology frequently misidentifies people,

with Former Detroit Police Chief James Craig admitting that the system almost never brings back a direct match and often leads to incorrect identifications.

Despite these issues, DataWorks Plus does not provide specific guidance to law enforcement on how to use the software, leaving decisions largely to the discretion of individual officers. This lack of oversight, combined with the technology's unreliability, has led to wrongful arrests and raised serious concerns among human rights advocates about the broader implications for privacy and racial justice.

The tag is: *misp-galaxy:surveillance-vendor="DataWorks Plus"*

Datong

Datong, formerly known as Sepura, is a UK-based company that has been involved in distributing surveillance technology, including IMSI Catchers, which can intercept mobile phone data. In 2009, Datong attempted to export an IMSI Catcher, branded "Optima," to an unnamed Asian country. The UK government rejected this export, citing human rights concerns. Datong attempted to do this by serving as a distributor to Cellxion, the manufacturer of the IMSI Catcher.

Datong was acquired by Seven Technologies Group on May 10, 2013, for $11.4 million. As of July 9, 2013, Datong plc operates as a subsidiary of Seven Technologies Ltd.

DEA Aviation

DEA Aviation Ltd is a UK-based provider of airborne technologies to various clients, including Frontex, the European Border and Coast Guard Agency, and the UK Ministry of Defence. Their products include aircrafts equipped with high-fidelity sensors and surveillance systems to collect real-time data. This is used by Frontex to monitor land and maritime borders, targeting migrants particularly in regions like the Mediterranean and off the Libyan coast.

Decision Group

Decision Group is a technology company based in Taiwan that provides solutions for lawful interception, network forensics, and surveillance. Their tools are designed to assist government agencies, enterprises, and intelligence organizations in monitoring and analyzing network traffic in real time. Their products include E-Detective, a real-time interception and forensics system capable of capturing, decoding, and reconstructing various types of Internet traffic, and Lawful Interception Suite (LI Suite), designed for targeted network surveillance. The suite consists of tools like iMediator (a mediation platform), iMonitor (for warrant administration and data presentation), and modules for decoding and archiving intercepted data.

DeepGlint

DeepGlint is a Beijing-based artificial intelligence company that develops computer vision and facial recognition technology. The company's systems can identify individuals and vehicles from distances up to 50 meters and alert authorities to specific activities. Its technology has been used by police agencies throughout China to track down individuals and for monitoring purposes. In 2021, the United States sanctioned DeepGlint for its involvement in human rights abuses, particularly related to the surveillance of Uyghur and other communities in China. It received early backing from Silicon Valley investor Sequoia Capital and became the first AI company listed on the Shanghai Stock Exchange STAR Market.

DeepGlint has a documented association with Microsoft through its participation in the Microsoft for Startups program. The program provided the company with resources such as Azure credits, mentorship, and office space.

Defendec

Defendec is an Estonia-based border surveillance technology company. Its main product, Smartdec, provides wireless, AI-powered detection and video surveillance systems that are easily deployable. Smartdec's network of lightweight, camouflaged cameras and motion sensors provides real-time alerts and visual confirmation of targets.

Defendec has secured significant contracts with organizations such asiddl the U.S. Department of State. Even in regions with limited GSM coverage, such as parts of the Middle East or Southeast Asia, Defendec's CEO Jaanus Tamm highlights the system's adaptability, using local radio networks as a bridge to maintain connectivity.

The company is supported by a network of investors and collaborators who are heavily involved in the surveillance industry, including Rajat Khare, the Indian hacking-for-hire specialist who collaborated with many governments and companies to hack emails and private messages on behalf of clients.

Digital Barriers

Digital Barriers is a provider of real-time video surveillance and analytics, primarily servicing law enforcement agencies. Its technologies include live video streaming over cellular networks, body cameras, and vehicle-mounted systems. The company has collaborated with Corsight AI to develop a facial intelligence system capable of real-time recognition using security cameras, body cams, and vehicle-mounted devices. Additionally, Digital Barriers has partnered with Sonic Communications to provide live surveillance capabilities for law enforcement agencies.

The company has also worked with NATO organizations and governments within the Five Eyes Anglosphere (United States, United Kingdom, Canada, Australia, and New Zealand). Their surveillance technologies have been deployed in military operations in Afghanistan and Iraq.

Digital Barriers has secured a contract with one of the largest police forces in Asia to install its TVI surveillance technology, a real-time live video streaming tool, in police vehicles as part of a multi-year program.

Digital Clues

Digital Clues is a company that offers omnichannel intelligence tools, and which shares the same founder with the notorious surveillance firm AGT International, Mati Kochavi. Their technology focuses on kickstarting investigations and surveillance operations by collecting and connecting data when initial clues are scarce or non-existent, including from the "surface web, deep web and dark web." In 2021, it was acquired by Cellebrite, an Israeli digital intelligence company also featured here for its extensive surveillance activities, and whose technologies have been sold to police, military, law enforcement agencies, and secret services in over 150 countries.

Digital Receiver Technology

Digital Receiver Technology (DRT), a subsidiary of Boeing since its acquisition in 2008, is a developer of surveillance and wireless communication tools, including IMSI catchers - devices used for intercepting mobile communications. These tools are widely utilized by intelligence and defense agencies for monitoring and gathering data. The company's clients include the U.S Department of Defense, U.S Department of the Army, and the U.S. Marshals Service.

In 2024, DRT was acquired from Boeing by Thales Defense and Security Inc (TDSI), a subsidiary of Thales.

DigitalStakeout

DigitalStakeout provides tools for monitoring and analyzing social media, specifically catered to law enforcement agencies. An analysis of the Corvallis Police Department's use of DigitalStakeout over 13 months revealed demographic disparities in flagged social media posts, with a higher representation of Black and Hispanic people. The monitoring tool has been used by police departments and agencies to track hashtags like #BlackLivesMatter.

DigiTask

DigiTask GmbH is a German company that develops surveillance tools and spyware for law enforcement and intelligence agencies. Best known for its controversial "Bundestrojan" (Federal Trojan) spyware, DigiTask provides software capable of intercepting encrypted communications, including VoIP calls, by installing malware on target devices. Their tools include features like keylogging, screenshot capture, remote file access, and the ability to bypass encryption protocols like SSL by intercepting keys on local systems.

DigiTask's products, such as the "WifiCatcher," are designed for covert operations, enabling authorities to monitor public WiFi networks and track users across hotspots. The spyware has been described as unsophisticated and easily detectable by cybersecurity experts, as revealed by investigations from groups like the Chaos Computer Club.

The company's tools have been sold to various governments, including those in Germany, Austria, Switzerland, and the Netherlands.

Discovery Telecom Technologies

Discovery Telecom Technologies (DTT), based in Moscow with offices in Switzerland and Salt Lake City, Utah, specializes in telecommunications interception technology. Wired reports that their AIBIS system (In-Between Interception System) operates by impersonating a cell phone tower to capture nearby signals covertly, enabling operators to eavesdrop and record communications. The company's clientele reportedly includes the Kremlin and the Federal Security Service (FSB), as stated on its Russian website.

Dream Security

Dream Security is a company co-founded by Shalev Hulio, the former CEO of NSO Group, an Israeli technology firm known for developing sophisticated surveillance tools, including the Pegasus spyware. The other co-founders include Sebastian Kurz, the former chancellor of Austria, and Michael Eisenberg, an Israeli American venture capitalist who is also a general partner of Aleph, a Tel-Aviv-based venture capital firm which participated in funding for Dream.

As of early 2025, the company claimed $130 million in annual sales, primarily from government agencies.

Dreamlab Technologies

Dreamlab Technologies, a Swiss company, was involved in a surveillance project in Turkmenistan in partnership with Gamma International GmbH (creators of the FinFisher spyware). Documents leaked by WikiLeaks revealed that Dreamlab helped establish an "Infection Proxy Infrastructure" on Turkmenistan's networks, enabling widespread surveillance. This infrastructure allowed for the infection of devices through fake software updates, file downloads, or website injections, granting full access to personal data, emails, social media messages, and even enabling remote control of microphones and cameras. Dreamlab provided technical services, including network analysis, hardware and software installation, staff training, and system maintenance. The leaked documents suggest the two companies also collaborated for similar interception projects in Oman.

According to Intelligence Online, Dreamlab has since diversified its operations, creating new ventures like Slinf, a threat intelligence firm co-founded with German SIGINT experts, which develops tools such as RATspotting for detecting command-and-control servers and CyKnife for open-source intelligence. Dreamlab previously collaborated with German defense group Rheinmetall to create the consulting firm Cyel. In 2019, Cyel was split, with part of its operations integrated into Dreamlab and the rest taken over by Rheinmetall under the name Cyber Works.

Dreamlab maintains offices in Switzerland, Germany, Spain, Oman, Malaysia, Australia, New Zealand, Bolivia, Peru, India, Malaysia and Chile.

DSIRF

The spyware developer, officially named DSIRF (Decision Supporting Information Research and Forensic), and operating under the codename KNOTWEED, created the spyware Subzero, which was used to target law firms, banks, and consultancy firms in the UK, Austria, and Panama. According to Microsoft's Threat Intelligence Center (MSTIC), DSIRF employed various exploits to compromise systems, including a zero-day privilege escalation exploit for Windows and a remote code execution attack via Adobe Reader. Former Austrian Chancellor Sebastian Kurz has close business ties to DSIRF, as well as ties to the founder of the NSO Group, Shalev Hulio, whom he co-founded Dream Security with.

DVTEL

DVTEL is a developer of video surveillance systems that cover security configurations from cameras to control rooms. Their products integrate video analytics, access control, license plate recognition, and facial recognition technologies, serving global clients in law enforcement agencies. DVTEL, through its acquisition of Israeli company ioimage Analytics, provided video surveillance technology deployed at Israeli military bases and border security installations.

In 2015, DVTEL was acquired by FLIR Systems for $92 million in cash. In May 2021, FLIR Systems was acquired by Teledyne Technologies for $8 billion, leading to the formation of Teledyne FLIR. As a result, DVTEL now operates under the Teledyne FLIR brand.

Echelon Edge

Echelon Edge, in collaboration with Synergy Telematics, has deployed India’s largest AI-driven surveillance and crowd management system for the Maha Kumbh. This system utilizes AI, big data analytics, and real-time monitoring, providing alerts and insights to police agencies in India. In an op-ed, the company’s founder and CEO, Gaurav Gandhi, wrote about the evolution of criminal profiling and prediction: "AI pulls in raw data from multiple sources - CCTV footage, law enforcement records, public databases, even social media activity. It then analyses behavioural patterns, identifying anomalies based on past movements, known risk factors, and predictive modeling."

Echo-On Technologies

Echo-On Technologies was founded in 2018 as a subsidiary of the Israeli firm Rayzone Group. Its primary product, Echo, is a surveillance tool designed to exploit vulnerabilities in telecommunications systems like SS7. It enables capabilities such as real-time location tracking, call interception, and SMS message retrieval. Echo is marketed primarily to governments and law enforcement agencies for intelligence gathering and surveillance purposes. It has reportedly been used in Mexico. The purchase was made via Neolinx, an intermediary in Mexico used to purchase surveillance equipment.

EDGE

EDGE, officially known as "EDGE Group," is a prominent defense conglomerate headquartered in Abu Dhabi, UAE. It was established in November 2019 as part of the UAE government's efforts to consolidate and modernize the country's defense industry. In 2022, it absorbed Digital14, a cybersecurity firm based in the Abu Dhabi and which had resumed the operations of DarkMatter, which operated under the codename Project Raven. Project Raven employed former NSA operatives and other foreign contractors to conduct hacking and surveillance activities, often targeting individuals and entities deemed as threats to the UAE government, such as journalists and human rights activists. In 2024, Edge partnered with the São Paulo State Government on a surveillance project called "Crystal Ball."

The tag is: *misp-galaxy:surveillance-vendor="EDGE"*

EDGE NPD

EDGE NPD, a Polish software company, developed ABTShield, a tool designed to monitor online narratives and identify disinformation and foreign influence campaigns. ABTShield claims to offer a range of surveillance capabilities, including the ability to compile social media posts by keywords or topics, track specific social media accounts and analyze social reactions to news and articles. The tool reportedly collects data from platforms like Facebook, Twitter, Parler, and Telegram, as well as news sources, forums, and blogs.

During a pilot with the Los Angeles Police Department (LAPD) in late 2020, the tool gathered

millions of tweets related to topics such as Black Lives Matter and "defund the police" movements. The tool also vacuumed up data on the conflict between Armenia and Azerbaijan, citing Los Angeles' large Armenian population, and included usernames and geolocation data of the tweets it gathered.

Known clients of ABTShield include the LAPD and the U.S. Embassy in Warsaw, which purchased licenses for the tool in 2020 and 2021.

Ekin

Ekin Technology, a Turkish firm, is a developer of AI-driven smart city surveillance systems, including facial recognition and license plate recognition (LPR). Their products, such as the Ekin Patrol G2 and Ekin Spotter, integrate multiple surveillance functions into mobile and fixed platforms. These systems are designed for real-time data analysis and centralized control via their Red Eagle operating system.

Elsight

Founded in 2009 by Nir Gabay and Roee Kash, Elsight is a company specializing in advanced communication technologies, particularly known for its innovative surveillance drones. These drones are designed to provide real-time data transmission for various applications, including "defense." Since October 7th, 2023, there has been a notable increase in demand for Elsight's systems from different defense entities. However, the company's management is unwilling to be transparent about this uptick in sales. They indicate that the heightened interest has a growing emphasis on military and defense applications, a trend expected to persist moving forward. "Military organizations worldwide have recognized the value of integrating cellular infrastructure for diverse operational uses," the company stated in an interview with Haaretz. Elsight has integrated its Halo connectivity platform with Lockheed Martin's Indago 4 quadcopter uncrewed aerial vehicle (UAV).

Endace

Endace, a New Zealand-based company, is a developer of high-speed network monitoring and packet capture technology. Its tools, such as the EndaceProbe Analytics Platform, are designed for network performance monitoring. These tools provide deep visibility into network traffic. Leaked documents have revealed that Endace's technology has been used to support mass surveillance efforts by governments worldwide. The company's tools have reportedly enabled the interception of private emails, online chats, social media activity, and other internet communications. Endace

has sold its technology to various countries, including the United States, the United Kingdom, Canada, and Israel, among others.

Endace was acquired by Emulex Corporation, a U.S.-based company that provides similar network connectivity and monitoring services, in February 2013.

Endeca

Endeca, a data analytics company, developed software capable of real-time social media monitoring and analysis, which was used by law enforcement agencies, such as the Chicago Police Department, to track and analyze protester activities during events like the 2012 NATO protests. The software allowed authorities to merge social media data with other datasets, such as crime records and 911 calls, enabling targeted surveillance and sentiment analysis. Oracle acquired Endeca in 2011, integrating its data analytics and monitoring capabilities into Oracle's broader goals towards AI-powered surveillance services.

Endoacustica

Endoacustica Europe, headquartered in Bari, Italy, is a provider of surveillance technologies. Their product lineup includes high-performance International Mobile Subscriber Identity (IMSI) catchers, which enable the detection and tracking of mobile devices by emulating legitimate cell towers, compelling nearby mobile phones to connect and capturing their IMSI numbers. This is used by law enforcement and intelligence agencies in monitoring and intercepting mobile communications.

According to its official website, Endoacustica's products are generally utilized by government agencies, law enforcement bodies, and security organizations requiring mobile surveillance and communication interception capabilities. These products include spy micro cameras, mini WiFi 4G IP Umts cameras, video surveillance drones, cellular spy, spy earphones, as well as various gadgets for related activities.

Epsilon

Epsilon is a Barcelona-based cybersecurity company specializing in developing exploits and targeting the American market. Founded by a group of elite researchers formerly linked to the Australian firm Azimuth, which was acquired by U.S. defense contractor L3Harris, Epsilon is led by a French researcher Jeremy Fetiveau (who used to work for L3Harris Trenchant) and also involves two Israeli partners, the founders of Bindecy, a lesser-known Israeli spyware firm.

Epsilon focuses on creating spyware tools tailored to the needs of intelligence agencies and law enforcement, specifically for clients demanding exclusive, custom-built solutions rather than off-the-shelf spyware.

Equitus

Equitus provides a product called the Equitus Video Sentinel (EVS), which transforms raw video streams into actionable intelligence using AI-driven analytics. EVS offers real-time object detection,

classification, and alert management. Equitus' technology is built on a Knowledge Graph Neural Network (KGNN), which unifies and analyzes large and complex datasets.

EVS is is explicitly marketed for border surveillance, capable of detecting and analyzing human and vehicle movements, including identifying individuals carrying items such as backpacks. The U.S. Customs and Border Protection (CBP) has been upgrading surveillance towers in Arizona by incorporating advanced machine learning technology to automate the detection of border crossings. Equitus' Video Sentinel is part of this effort, working alongside IBM's Maximo Visual Inspection software. The project processes up to 100 simultaneous video streams, with data being hosted on Google's cloud platform, MAGE (ModulAr Google Cloud Platform Environment), which serves as the central repository for video analysis.

Equus Technologies

Equus Technologies is an Israeli company behind an advanced spyware, known as "Lipizzan," designed to steal users' data. The company offers custom solutions for law enforcement, intelligence agencies, and national security organizations. According to Google researchers, Lipizzan is a multi-stage spyware capable of monitoring and extracting a user's emails, SMS messages, location data, voice calls, and media files. Google identified 20 Lipizzan apps, which were distributed in a highly targeted manner to fewer than 100 devices. In response, Google has blocked both the developers and the apps from the Android ecosystem. Besides malware, the source reported that Equus Technologies also offers app and cloud interception technology packaged as portable devices. These devices, which can be carried in backpacks, are designed to connect to nearby cellphones and steal passwords along with other sensitive personal data. At least one employee of Equus Technologies is a former staff member of NSO Group, the notorious Israeli malware vendor.

After their exposure in numerous reports in 2017, the company rebranded its name to Merlinx.

eSurv

eSurv was an Italian company that sold spyware to law enforcement. Initially a developer of video surveillance software for homes and offices, the company later transitioned to creating spyware for mobile phones. eSurv's spyware, named "Exodus," was distributed through phishing sites that mimicked mobile carriers in Italy and Turkmenistan. The iOS version exploited Apple's Developer Enterprise Program to bypass the App Store's review process. The spyware had capabilities to access contacts, photos, GPS location, audio recordings, and more.

Connexa, a telecommunications company in Italy, partnered with eSurv to provide the infrastructure for Exodus. Connexa's servers were used to host the spyware's command-and-control infrastructure, enabling the collection of sensitive data from infected devices.

eSurv declared bankruptcy in 2021.

Everfox

Everfox, formerly the public sector division of Forcepoint, provides tools for monitoring employee activity and analyzing behavior. Its Insider Risk Solutions platform collects data from various channels, including web activity, file operations, emails, and keystrokes, to provide organizations with a comprehensive view of employee behavior. This data is used to calculate "risk scores" for employees, flagging behaviors such as data exfiltration, financial distress, or signs of dissatisfaction or whistleblowing.

Everfox’s technology utilizes AI-driven behavioral analytics to detect what they call "anomalous" activities, such as accessing restricted files or exhibiting "negative sentiment" in communications. Its clients include the U.S. Department of Defense.

Eyecool Technology

Eyecool Technology, formerly known as Techshino, is a Chinese biometrics company that develops facial and iris recognition systems and has deep ties to China's public security and military sectors. The company, a supplier to the Ministry of Public Security and the People's Liberation Army (PLA), has expanded its technology's applications to smart city projects, including the Xiong'an initiative championed by President Xi Jinping. Eyecool also collaborates closely with China's Ministry of State Security.

The company reportedly adds 2 million facial images daily to Skynet, China's mass video surveillance network.

Eyecool Technology maintains a global presence with subsidiaries in the Netherlands, United States, and India, while also exploring opportunities in Malaysia.

FaceFirst

FaceFirst, also known as Airborne Biometrics, is a developer of facial recognition and surveillance technologies, providing automated face-matching systems for use in retail, airports, stadiums, military bases and at border checkpoints.

Its facial recognition technology has increasingly been deployed in retail stores without customer knowledge or consent. The system scans shoppers' faces as they enter stores, comparing them to databases of "dishonest customers" or "known shoplifters." The system also delivers customizable alerts and notifications to any device or workstation upon detecting a person of interest. The company claims to offer military-grade facial identification that seamlessly connects to a large central database tailored to the specific needs of the end user.

In 2022, FaceFirst welcomed Edwin Coello, a former leader of the NYPD Real Time Crime Center, to its team.

FaiceTech

FaiceTech is a UK-based developer of facial recognition technology. It has been implicated in helping Hikvision, a Chinese security camera giant, circumvent international sanctions over its

involvement in surveillance and human rights abuses in Xinjiang. Hikvision advertised ethnicity recognition features in marketing brochures, claiming collaboration with FaiceTech. Following an investigation, Hikvision removed promotional materials referencing FaiceTech.

Falcon

The Falcon system, developed by Semptian, is primarily designed for tracking the location of targeted cellphones rather than intercepting calls or texts. Similar to the Stingray devices used by U.S. law enforcement, Falcon operates within a nearly 1-mile radius and can pinpoint the location of cellphones with high precision, up to 5 meters accuracy. When activated, Falcon emits signals that compel nearby mobile phones and other cellular devices to connect to it, revealing their exact locations. Falcon includes a smaller, pocket-sized device that can be used by agents on foot to track cellphone locations even more precisely, narrowing down to within 1 meter. This technology enables authorities to conduct targeted surveillance and locate specific individuals within urban or densely populated areas.

FalcoNet

FalcoNet is a surveillance technology developed by the Israeli firm Cognyte, designed as a cell tower simulator capable of intercepting and collecting data from mobile phones. It functions as an airborne system, deployable on manned aircraft like helicopters or fixed-wing planes, and is used to gather unique identifiers from phones, intercept unencrypted communications, and jam normal signals to force devices to connect to its artificial station. The State of Florida purchased this

technology for $793,000 as part of Operation Vigilant Sentry, aimed at surveilling migrants, particularly from Haiti.

FiberHome

FiberHome, officially known as Nanjing FiberHome StarrySky Communication Development Company Ltd., develops spyware for use by the Chinese authorities. Its Fengcai app is forcibly installed on tourists' smartphones at border crossings in the East Turkistan (renamed Xinjiang by China) region. This spyware collects extensive personal data, including text messages, contacts, call logs, calendar entries, and installed apps, and transmits it to remote servers for analysis. The app also scans for content flagged as suspicious, such as religious materials, writings in Arabic, or documents related to the Dalai Lama, among other flagged items.

Fifth Dimension

Founded in 2014 by former Mossad member Doron Cohen, Fifth Dimension became a leading producer of surveillance technology with the backing of notable figures such as former IDF Chief of Staff Benny Gantz, who served as the company’s chairman, and former Mossad deputy head Ram Ben-Barak. The company’s systems are employed to analyze vast amounts of data, including social media activity, to identify potential security threats and prevent incidents before they occur. The company specializes in predictive policing tools and advanced data analysis, including sophisticated data processing techniques to identify patterns and correlations based on mass surveillance data.

Fifth Dimension collaborated with the Israel Police on a project involving artificial intelligence for law enforcement purposes. This partnership, which did not go through a tender process, involved a

pilot program costing about 4 million shekels ($1.1 million) and concluded in 2017. The initiative was described as a "game changer" by Police Chief Roni Alsheikh. However, Fifth Dimension ceased operations due to U.S. sanctions on one of its investors, Viktor Vekselberg, which affected its primary market in the U.S.

The company ceased operations in December 2018, after an unsuccessful acquisition bid from NSO Group. At its height, Fifth Dimension had secured $40 million in funding and employed 100 people.

FinFisher

FinFisher, also known as FinSpy, is surveillance software developed by Gamma Group, an Anglo-German technology company specializing in surveillance and monitoring solutions. FinFisher has been used by various governments and law enforcement agencies around the world for surveillance purposes. The software is designed to monitor and intercept communications, gather intelligence, and track individuals' activities. FinFisher is known for its comprehensive surveillance capabilities, which include: remote access, data extraction of information such as emails, SMS, files, and browser history, real-time monitoring of communications and online activities, keylogging to capture passwords and other sensitive information, microphone and camera activiation to record audio and video, as well as geolocation tracking. Gamma Group dissolved its FinFisher unit in 2014, but several German companies have since sold the spyware.

First WAP

First WAP is a surveillance technology company headquartered in Jakarta, Indonesia. It was founded by former Siemens engineer Josef Fuchs in the early 2000s. The company's primary product, Altamides, is a phone-tracking software that exploits vulnerabilities in the global telecom network's SS7 protocol to pinpoint any person's location worldwide. Over time, First WAP has expanded Altamides' capabilities beyond location tracking to include intercepting SMS messages, listening to phone calls, and breaching encrypted messaging apps like WhatsApp.

First WAP's surveillance technology has been used across more than 160 countries, tracking over 14,000 unique phone numbers. The company marketed its products to authoritarian governments and made them accessible to corporate actors through a network of middlemen. Specific clients included governments in Morocco and Algeria during the Arab Spring, marketed through the British firm KCS Group. Victims of the surveillance ranged from high-profile political figures and journalists to ordinary citizens like teachers and therapists.

Fisca Security

Fisca Security & Communication is a Yangon-based company that provides telecommunications and security products, including CCTV systems, intercoms, and related infrastructure.

Since the 2021 military coup in Myanmar, Fisca has been involved in the procurement and installation of surveillance technologies, including Chinese-made CCTV cameras with facial recognition capabilities. These systems have been deployed in multiple cities across the country as

part of "safe city" initiatives. The company is sourcing its surveillance technologies from China's Zhejiang Dahua Technology, Huawei, and Hikvision.

In 2023, the U.S. Department of Commerce added Fisca to its Entity List, citing the company's involvement in supplying surveillance equipment to Myanmar's military regime.

The tag is: *misp-galaxy:surveillance-vendor="Fisca Security"*

Fivecast

Fivecast is a company that develops AI-powered software used by U.S. Customs and Border Protection (CBP) to analyze online content for potential threats. Utilizing artificial intelligence, Fivecast's software detects sentiment and emotion in social media posts and recognizes objects in images and videos. It also scans for "risk terms and phrases" across multiple languages, gathering data from both major social platforms like Facebook and Reddit, as well as smaller communities like 4chan and Gab.

CBP has spent millions on Fivecast's technology, which they use to monitor individuals they believe may pose risks to public safety, national security, or lawful trade and travel. Fivecast's tools are capable of mapping out networks of connections and tracking persons-of-interest starting with minimal information, as demonstrated in their promotional materials.

Fivecast is headquartered in Adelaide, Australia. The company was co-founded in 2017 by Brenton Cooper, Duane Rivett, Ross Buglak, and David Blockow. Fivecast has a strong connection to the Five Eyes intelligence alliance, which includes agencies from the United States, United Kingdom, Canada, Australia, and New Zealand. The company's tools have been developed in consultation with law enforcement and intelligence agencies from these Five Eyes nations, optimizing their software to meet the specific requirements of these agencies for monitoring and analyzing online threats.

Flock Safety

Flock Safety is a technology company that specializes in providing advanced surveillance solutions. Their products include Flock Camera, which are high-definition cameras placed to capture clear images of vehicles entering and exiting neighborhoods and which utilize automated license plate recognition (ALPR) technology to identify and log vehicle data, as well as AI-powered audio detection systems. They also feature FlockOS in their suite of products, which integrates first and third-party data from video, license plate recognition (LPR), and audio detection to provide real-time intelligence through advanced search, a customizable map and other options.

In 2024, Flock Safety acquired drone startup Aerodome for over $300 million. This acquisition allows Flock Safety to broaden its reach into autonomous police drone surveillance.

In 2025, it was revealed that the company was considering using hacked or breached data to create Nova, a surveillance tool intended for law enforcement use. That same year, a report by 404 Media revealed that a Texas police officer used Flock's nationwide license plate camera network to track a woman who had traveled out of state to obtain an abortion.

In October 2025, Amazon's Ring announced a partnership with Flock, enabling agencies that use Flock to request Ring users to share surveillance footage.

Fog Data Science

Fog Data Science, a data broker, sells location data about individuals to law enforcement agencies, obtained from thousands of apps on Android and iOS app stores. The company's web application, Fog Reveal, provides detailed histories of people's lives, selling access for less than $10,000 per year. In the U.S alone, Fog has past or ongoing contractual relationships with at least 18 local, state, and federal law enforcement clients. Fog's service allows for "pattern of life" analyses, revealing an individual's daily routines and habits. The service can execute broad searches, such as gathering device IDs for everyone in a specific area.

The company also uses a "Project Intake Form" that requests detailed information about persons of interest, including their medical provider locations, and harvests location data from smartphones through apps and advertising systems. Critics, including former law enforcement officials, have expressed alarm over the tool's ability to track individuals in private spaces, such as homes, without judicial oversight.

The company was founded in 2016 by two former Department of Homeland Security officials, Robert Liscouski and Matthew Broderick, who served under President George W. Bush.

The tag is: *misp-galaxy:surveillance-vendor="Fog Data Science"*

Forenza

Forenza is the developer of a platform designed to assist police forces to access, organize and analyze social media data from sites and apps like Instagram, YouTube and TikTok. One of the platform's features is the ability to categorize and analyze public videos for specific traits, such as license plates, road signs, or tattoos to support law enforcement to identify people, vehicles, documents or locations.

The platform is currently used by police forces in Israel, with plans to expand to the U.S.

Forenza was co-founded by Efim Lerner and Uri Boros, who were also the founders of Bler Systems, a subsidiary of the Avnon Group, and which also develops a range of surveillance tools.

Fraunhofer IOSB

The Fraunhofer Institute of Optronics, System Technologies, and Image Exploitation (Fraunhofer IOSB) is a research organization based in Karlsruhe, Germany. It develops what they market as "intelligent video surveillance systems" which includes AI-driven image analysis and tracking movement patterns. The institute has been a key partner in Mannheim's pilot surveillance project, which began in 2018. The system, which includes 76 cameras installed in what they consider to be "high-crime areas", transmits surveillance data to the Mannheim Police Headquarters via a sealed fiber-optic network.

Frontiir

Frontiir is a Myanmar-based internet service provider (ISP) that has been facilitating digital surveillance for the country's military junta. The company operates under the Myanmar Net brand, providing internet services to millions of users. Investigations have revealed that Frontiir hosts surveillance equipment developed by Geedge Networks, a Chinese cybersecurity firm founded by Fang Binxing, known as the "father" of China's Great Firewall. This equipment reportedly enables

the interception and decryption of web traffic, blocking of websites, and prevention of Virtual Private Network (VPN) usage, thereby restricting access to uncensored information. Frontiir's Yangon data center has been identified as housing this surveillance technology.

G4S

G4S is a British multinational security services company headquartered in London, United Kingdom. It provides a wide range of security-related services, including manned guarding, electronic security systems, and monitoring services. G4S has been involved in providing surveillance tools for Australia's offshore immigration detention centers, such as those on Manus Island. It has also provided surveillance equipment and services to Israeli checkpoints, prisons and police stations in the West Bank and Gaza. G4S has been responsible for managing and providing surveillance equipment at several immigration detention centers in the UK, such as Brook House and Tinsley House, which suffer from staff abuse, neglect, mistreatment of detainees, and poor living conditions. In 2021, Allied Universal acquired G4S for $5.28 billion.

Gaggle

Gaggle is a Dallas, Texas based company that provides ongoing AI-powered surveillance in schools. The students' digital activities are closely monitored for indicators of certain behaviors. This surveillance includes homework, emails, photos, and chats, with alerts potentially leading to interventions that include police involvement. In some schools, Gaggle was integrated into all

school-issued Chromebooks, working with Google services such as Gmail, Google Docs, Google Slides, and Google Sheets. Whenever students type something, Google's auto-save feature activates, automatically routing the saved content through Gaggle for monitoring. As of May, 2024, Gaggle is currently in at least 1,500 K-12 districts in the U.S.

Geedge Networks

Geedge Networks is a Chinese cybersecurity firm that helped build China's "Great Firewall" and now sells a commercialized version of that system abroad. Founded in 2018, the company's Tiangou Secure Gateway can filter websites and apps, conduct real-time surveillance, throttle or shut down entire regions of the internet, pinpoint anonymous users, and automatically block circumvention tools such as VPNs and Tor.

Leaked internal files show Geedge exporting these capabilities to authoritarian clients, including Kazakhstan, Ethiopia, Myanmar and Pakistan. In Pakistan, Geedge tech replaced Sandvine equipment in 2023 to create "WMS 2.0," the country's upgraded national firewall.

Engineers at Geedge actively reverse-engineer popular privacy tools, listing commercial VPNs as "resolved" problems and rolling out blockers like the Psiphon detector deployed after Myanmar's 2021 coup.

General Atomics

General Atomics Aeronautical Systems, Inc. (GA-ASI) is a major American aerospace company based in San Diego, California. GA-ASI designs and builds unmanned aircraft, most notably the Predator drone, which is widely used by the U.S. military and allied forces for surveillance and strike missions. The company operates as a subsidiary of General Atomics, a private firm established in 1955. GA-ASI has played a key role in advancing drone technology since the 1990s, supplying long-endurance aircraft and sensor systems for defense and intelligence operations. In June 2025, 404 Media revealed that the company's drones were used to surveil protests in Los Angeles.

General Dynamics

General Dynamics Corp is a major U.S. defense contractor involved in the development and deployment of surveillance technologies used in border enforcement and immigrant monitoring. Between 2005 and 2019, the company was a key contractor for U.S. Customs and Border Protection (CBP), building a so-called "smart/virtual" border along the U.S.–Mexico. Its Remote Video Surveillance Systems (RVSS), equipped with day and night capable cameras mounted on vehicles, enable near-constant monitoring of border regions, giving authorities unprecedented oversight over the movement of migrants.

General Dynamics Information Technology (GDIT), the company's IT and services arm, has expanded this surveillance infrastructure, including modernizing CBP's tower systems under the Consolidated Tower & Surveillance Equipment (CTSE) program. These towers, deployed across southern border regions such as Arizona (Nogales, Naco, Yuma, and Ajo) and Texas's Rio Grande Valley, concentrate state surveillance in communities where migrants are most vulnerable. Newer contracts also extend surveillance infrastructure to parts of the northern U.S. border with Canada, where surveillance towers are being installed or upgraded.

General Robotics

General Robotics Ltd. (GRL), based in Hod Hasharon, Israel, specializes in developing advanced robotic systems for military and defense applications. One of its products, "Pitbull", can be mounted on various platforms for remote surveillance activities. It was acquired in March, 2022 by the American company Sig Sauer, one of the world's leading arms, ammunition, and optical sights companies.

Genetec

Genetec is a prominent provider of surveillance technology, supplying law enforcement with a range of invasive monitoring tools. Their offerings include video management systems, automatic license plate recognition (ALPR) software, and real-time crime center (RTCC) analytics to expand police surveillance networks. Genetec also leads a program to facilitate the process for law enforcement agencies to request and retrieve footage from private cameras.

In 2017, Genetec developed the Citigraf platform specifically for the Chicago Police Department (CPD), one of the largest police forces in the U.S., to help manage and analyze their extensive data collection. Powered by Microsoft Azure, Citigraf integrates information from surveillance sensors and database records, using both real-time and historical data to generate calculations, visualizations, and alerts that provide CPD with "deep situational awareness." Microsoft is collaborating with Genetec to advance this platform with a "correlation engine" designed to interpret surveillance data more effectively. In 2016, the city of Detroit in Michigan launched Project Green Light, which uses Genetec Stratocast and Microsoft Azure to stream surveillance footage from local businesses and other entities to the Detroit Police Department.

Microsoft has long provided facial recognition services to law enforcement through its extensive partnerships with Genetic and similar companies.

Geo Group

Geo Group is the largest private prison operator in the United States headquartered in Boca Raton, Florida. The company develops and distributes digital surveillance tools, including ankle monitors, smartwatches, and tracking apps to monitor immigrants under the U.S federal government's "Alternatives to Detention" program. This program, designed to track the whereabouts of immigrants, has been a lucrative venture for Geo Group, generating significant revenue.

The company's surveillance technology, including its facial recognition-powered SmartLink app, allows constant monitoring of immigrants' locations. Geo Group's technology has also facilitated deportation efforts, with its data being used by Immigration and Customs Enforcement (ICE) to locate and detain immigrants.

Geo Group operates internationally, including in South Africa, Australia, and the United Kingdom, where it provides monitoring and surveillance services related to prisons and mental health facilities.

The tag is: *misp-galaxy:surveillance-vendor="Geo Group"*

Geolitica

Geolitica, formerly known as PredPol, short for "Predictive Policing," is a software company that claims to use historical crime data to predict where crimes are likely to occur. Its surveillance capabilities rely on analyzing past crime reports, including time, location, and type of crime, to generate "hot spots" for law enforcement to monitor. This data-driven approach enabled police departments, such as the LAPD, to direct patrols and resources to specific areas flagged by the system. PredPol however specifically targeted Black and brown neighborhoods in the U.S, and its algorithms created often false and misleading data that intensified surveillance in these communities.

The tag is: *misp-galaxy:surveillance-vendor="Geolitica"*

Geotab

Geotab is a provider of vehicle tracking and fleet management products. Its Geotab GO9 device provides comprehensive telematics capabilities, including real-time GPS tracking, vehicle diagnostics, and driver performance monitoring. Geotab has partnered with government agencies, including providing vehicle tracking systems to the U.S Immigration and Customs Enforcement (ICE). These systems allow ICE to monitor the locations and movements of vehicles used in immigration enforcement operations.

Geotab also works with police departments in Canada. The Belleville Police Service in Ontario has implemented Geotab’s telematics solutions in its fleet of 31 vehicles, including sedans, SUVs, and pickups.

The company claims to have devices installed in 130 countries and on all 7 continents. It also maintains offices in the U.S., the U.K., Germany, Spain, Australia, Mexico, China, France, Italy and Singapore.

Ghost Robotics

Ghost Robotics is a Philadelphia-based company that specializes in the development of advanced robotics systems, particularly focused on legged robots. Ghost Robotics' robots, like the Ghost Minitaur and others in their lineup, are equipped and utilized for surveillance purposes. The Israeli army has been using the company's robots in Gaza, according to news reports in Haaretz and other sources.

Its Vision 60 Quadrupedal Unmanned Ground Vehicles (Q-UGVs) have been deployed by the U.S. military for various applications. The U.S. Air Force has utilized these robotic systems at Tyndall Air Force Base and during Advanced Battle Management System (ABMS) exercises.

In 2024, Ghost Robotics entered a "strategic partnership" with South Korea's LIG Nex1, which acquired a 60% controlling stake in the company for $240 million.

Giant Oak

Giant Oak Inc. is a U.S.-based company that develops data analytics and monitoring technologies. Their primary product, Giant Oak Search Technology (GOST), is a tool designed to analyze and filter large amounts of online data, including social media, to identify individuals and networks of interest. Founded by Gary Shiffman, a former U.S. Navy veteran and DARPA researcher, Giant Oak has received millions in U.S government contracts since 2014. These contracts include work with agencies such as Immigration and Customs Enforcement (ICE), the Department of Homeland Security (DHS), and others, for purposes such as immigration enforcement and intelligence

investigations.

Originally developed from earlier projects like "Social Locator," GOST creates detailed profiles by analyzing digital traces, highlighting keywords, and providing visual summaries of online activity. It has been used to flag "derogatory" content on social media. GOST also allows agencies to search for individuals using identifiers like names, addresses, or emails and ranks results based on specific requirements. Additionally, it can screen and rank large groups of individuals simultaneously.

In February 2024, Saifr, a compliance solutions provider created by Fidelity Investments, announced the acquisition of GOST.

Glimmerglass

Glimmerglass was a U.S.-based technology company that built optical networking products, including technology that facilitates the interception of undersea fiber-optic cables.

Glimmerglass has reportedly provided systems capable of monitoring and analyzing internet traffic, including services like Facebook, Twitter and Gmail. Their technology included 3D MEMS (Micro-Electro-Mechanical Systems) solutions, which allow for the interception and duplication of light signals transmitted through fiber-optic cables. This enables agencies to capture the full content of communications, not just metadata, for intelligence purposes. The company has acknowledged that its systems are deployed in multiple countries for "lawful interception" under anti-terrorism laws. Its tools are marketed as providing intelligence agencies with full control over massive flows of data, including the ability to analyze communications in real time. Confidential materials from Glimmerglass have demonstrated its ability to map social networks, monitor webmail, and intercept phone calls.

The company was re-named “VSocial Technologies” in 2021 and continues to operate under that brand.

The tag is: *misp-galaxy:surveillance-vendor="Glimmerglass"*

Gloo

Gloo, a data analytics company, uses digital surveillance to benefit churches and evangelical campaigns. The company mines personal online data, often belonging to vulnerable populations like immigrants or those facing personal crises, to enable churches to target individuals.

Gloo has been linked to campaigns like the $1 billion "He Gets Us" initiative, which uses targeted advertising to promote Christian messages. Although "He Gets Us" initially denied selling data to Gloo, evidence showed that Gloo used data from their campaigns to sell contact information of individuals seeking spiritual support to churches.

Through Gloo’s Explorer program, the personal data of individuals responding to "He Gets Us" social media ads was sold to local pastors or anyone willing to pay $49/month. This included sensitive information, such as contact details, without proper vetting or guidelines on how the data should be used. In one incident, a pastor publicly shared private messages from a person and exposed her identity to everyone in her church after she responded to an ad on Instagram.

The tag is: *misp-galaxy:surveillance-vendor="Gloo"*

GoLaxy

GoLaxy surveils and shapes online opinion for the Chinese Communist Party (CCP). Its platforms ingest social media data, map networks of political actors and influencers, and use AI to generate and deploy content; operators monitor sensitive topics (Taiwan, Hong Kong, Xinjiang, U.S. politics) and intervene by seeding narratives or amplifying aligned voices in order to flood information channels with pro-government messaging. It tracked people in Hong Kong to counter opposition to the 2020 Hong Kong National Security Law.

GoLaxy's primary customers are CCP propaganda departments, state security services, provincial police departments, and the military. The company's inner workings were exposed through nearly 400 pages of leaked planning documents. The company maintains close ties with the Chinese Academy of Sciences and pitches its tools to provincial-level agencies that fund localized monitoring and influence operations.

The tag is: *misp-galaxy:surveillance-vendor="GoLaxy"*

Gravy Analytics

Gravy Analytics is a company that provides location intelligence and data analytics services. It's the parent company of Venntel, which sells smartphone location data, including to U.S. government agencies. It provides detailed location data that can help law enforcement agencies understand patterns of movement and behavior in specific areas. In 2023, Gravy Analyrics merged with Unacast, a company that uses machine learning and artificial intelligence to provide location intelligence products.

In January 2024, hackers claim to have breached the company. The hackers allege they have stolen sensitive data such as customer lists, industry information, and precise location data from

smartphones, threatening to release it publicly.

Grayshift

Grayshift, an American company best known for its tools to unlock encrypted mobile devices, has reportedly supplied its technology to Belarusian authorities to hack into locked mobile devices, aiding the Belarusian government in its extensive surveillance operations. These measures include real-time video monitoring systems and direct access to communications data.

Its core product, GrayKey, is a forensic access tool that enables the extraction of encrypted or inaccessible data from mobile devices, including those protected by alphanumeric passcodes.

In 2023, Grayshift merged with Magnet Forensics, a Canadian digital forensics company, to create a combined entity focused on providing advanced digital investigation tools to law enforcement and public safety agencies.

The tag is: *misp-galaxy:surveillance-vendor="Grayshift"*

Griffeye

Griffeye is the Swedish developer behind Griffeye Analyze Deep Pro, a multi-source data analysis system for police forces. According to the Balkan Investigative Reporting Network (BIRN), the Ministry of Internal Affairs (MUP) of Serbia purchased Griffeye facial recognition software in 2022.

Griffeye Analyze DI Pro can recognize faces based only on the eyes, even when the eyes are not visible under certain conditions. It can also download large amounts of personal data from the internet and then search, sort, cross, and process it based on metadata such as GPS coordinates, the time when an image was taken, or phone serial numbers. Europol has used the software since 2019.

The Griffeye Analyze platform is used by over 1,000 police agencies across the world.

Magnet Forensics, a developer of digital investigation technologies used in over 90 countries, acquired Griffeye in August, 2023.

The tag is: *misp-galaxy:surveillance-vendor="Griffeye"*

Group 42 (G42)

Group 42, more commonly known as G42, is a UAE-based artificial intelligence whose staff include former members of DarkMatter, which was staffed by former NSA operatives who conducted hacking and surveillance on behalf of the United Arab Emirates under the codename "Project Raven." Human rights advocates and journalists are often targeted. Among them was G42 CEO Peng Xiao, who for years ran DarkMatter's Pegasus program. In 2021, three former U.S. intelligence and military officials admitted to providing sophisticated computer hacking technology to the UAE while working at DarkMatter. The firm has established a joint venture with state-owned Israeli defense company Rafael Advanced Defense Systems.

G42 has been linked to surveillance through its acquisition of UAE's Botim app, which is officially promoted as a secure messaging and VoIP platform but has been reported to facilitate government monitoring of users' communications.

Botim was developed by Algento, a private American technology company headquartered in San Francisco, California. The company operates subsidiaries in Dubai (Algento DMCC), Beijing (Beijing Aojintuo), and Hong Kong (Algento Cloud Computing Limited).

H3C Technologies

H3C Technologies, also known as New H3C, is a joint venture originally established between Hewlett-Packard Enterprise (HPE) and China-based Unisplendour Corporation, a subsidiary of the state-owned Tsinghua Holdings. H3C's technology is deeply embedded in China's extensive surveillance system. The company has developed an internet protocol (IP) telephone network for

the Xinjiang Public Security authorities, a key component of the region's repressive monitoring network. This system integrates mobile apps, biometric data collection, artificial intelligence, and big data to monitor and control the activities of millions of Uyghurs in Xinjiang. H3C also sells internet firewall products.

Hakluyt

Hakluyt & Company is a London-based intelligence agency known for its discreet operations and high-level clientele, including multinational corporations and governments. The firm is notable for its ties to the intelligence community, as it is staffed predominantly by former officers from agencies such as MI6, the CIA, and other elite intelligence organizations.

In 2001, BP and Shell were called out for hiring Hakluyt to spy on Greenpeace activists.

In 2021, Hakluyt opened a subsidiary in Dubai called Hakluyt & Company (Middle East) FZE.

Hanwang Technology

Hanwang Technology, also known by its English name Hanvon, is a publicly traded Chinese tech company founded in 1998 by Liu Yingjian, a former communications specialist in the People's Liberation Army. Initially focused on handwriting recognition, Hanwang used funding from China's 863 Program to expand its technologies.

Hanwang has refocused its efforts on artificial intelligence, particularly facial recognition technology, becoming a prominent partner of China's Ministry of Public Security (Gonganbu). Its products include mask-compatible facial recognition. This system uses advanced algorithms and thermal sensors to analyze visible facial features, such as the eyes and forehead, to confirm identities. It has been used to monitor public spaces and track individuals in crowded areas.

Hawk Analytics

Hawk Analytics is the developer of CellHawk. Widely used by law enforcement agencies, private investigators, and legal teams, CellHawk processes extensive datasets from cellular providers, including call detail records (CDRs), location data, ride-hail logs, and tower dumps, to create detailed maps of individuals' movements, relationships, and communication patterns. Its

capabilities extend to analyzing ride-hailing and GPS data, offering features like animation tools to visualize movement and alerts for specific geofenced areas. It also integrates with Cellebrite exports, and ankle-bracelet monitoring.

The software has been employed in high-profile cases, such as tracking phone activity in investigations tied to Donald Trump's legal battles. Trump's team used CellHawk to analyze phone records of a prosecutor, revealing thousands of calls and texts, and mapping their locations.

In 2022, it was acquired by LeadsOnline.

HENSOLDT

HENSOLDT provides surveillance technologies designed to be integrated with drones. While the company itself does not manufacture drones, it develops advanced sensor systems that are often used in unmanned aerial vehicles (UAVs) for surveillance purposes. HENSOLDT's ARGOS-II HD electro-optical infrared (EOIR) system is frequently mounted on drones to provide high-resolution imaging and real-time surveillance capabilities. It also incorporates AI into its surveillance and sensor technologies. HENSOLDT, with funding from Germany, has supplied border control and surveillance equipment to Tunisia, along with providing training to the Tunisian military.

Herta Security

Herta Security, a Spanish company that develops facial recognition technology, has been involved in providing surveillance solutions globally. In India, Herta's facial recognition technology has reportedly been deployed by the Indian Railways as part of its mass surveillance initiatives. This system is used to monitor passengers and identify individuals of interest.

According to the company, its clientele includes police forces in countries like Germany, Spain, Uruguay, and Colombia, as well as sports stadiums, shopping centers, hotel chains such as Marriott and Holiday Inn, airports, and casinos.

The tag is: *misp-galaxy:surveillance-vendor="Herta Security"*

Hiddentec

Hiddentec develops GPS tracking equipment that provide real-time information. The company's HT Pro software is a feature-rich platform for tracking and monitoring data. The software displays incoming messages from trackers in a filterable, tabular format and shows available GPS information on a mapping screen.

According to its official website, Hiddentec's surveillance equipment and trackers are in use globally within law enforcement, military, and government institutions.

MetOcean Telematics acquired Hiddentec Group in August, 2022.

HK Medsourcing

HK Medsourcing is a company that sells International Mobile Subscriber Identity (IMSI) catchers, an intrusive technology used to locate and track all mobile phones that are switched on within a

specific area. It operates by masquerading as a mobile antenna, which tricks nearby phones into connecting to it. A significant concern with IMSI catchers is their frequent secret deployment, often lacking a clear legal foundation and the safeguards and oversight mechanisms that international human rights law mandates for other surveillance technologies.

Horizon Robotics

Horizon Robotics develops AI-powered surveillance technologies, including facial recognition cameras and smart city solutions. According to company sources, its HR-IPC2143 smart camera achieves facial recognition accuracy up to 99.7% and can detect, track, and identify up to 200 objects in real time. These systems are designed for mass monitoring applications, such as identifying targets in crowded areas or large events. The cameras use Horizon’s proprietary "Sunrise" AI processor, which integrates algorithms, chips, and cloud systems for efficient video analysis.

The company also collaborates with state-owned enterprises and government initiatives in China, such as the 973 Program, also known as the National Basic Research Program of China.

The tag is: *misp-galaxy:surveillance-vendor="Horizon Robotics"*

Horizon Technologies

Horizon Technologies is a developer of airborne intelligence and surveillance solutions. One of its products, FlyingFish, is an advanced airborne Signals Intelligence (SIGINT) system designed to monitor satellite communications. It is capable of passively intercepting satellite phone signals to determine the location of users and gather intelligence in real time. Frontex, the European Border and Coast Guard Agency, utilizes FlyingFish systems as part of its border surveillance initiatives. These systems are deployed on ISR aircraft to monitor migration routes and enable Frontex to track satellite phone signals often used by migrants.

Huadi

Huadi is a Chinese defense contractor and state-owned subsidiary of China's largest missile military contractor, originally spun off from China's Ministry of Defense. The company helped develop China's mass surveillance infrastructure through partnerships with major U.S. technology companies, particularly IBM.

Huadi's surveillance capabilities include designing and implementing the "Golden Shield" policing system, which Beijing uses to censor the internet and crack down on dissidents. In 2009, the company collaborated with IBM to build national intelligence systems, including a counterterrorism database used by the Chinese military and the Ministry of State Security (China's secret police.)

The company also worked with IBM to construct China's national fingerprint database, expanding the government's biometric surveillance capabilities.

The tag is: *misp-galaxy:surveillance-vendor="Huadi"*

ICOMM

ICOMM Media & Tech, a subsidiary of Hanoi Telecom Corporation (HTC), won a contract worth VND 5.6 billion ($225,000) from Ho Chi Minh City to deploy SocialBeat, an AI-powered social media monitor. The software is capable of processing billions of data points daily, drawing from over 20 million social media accounts, and has been widely adopted by government bodies.

Over the years, ICOMM has won numerous state contracts for surveillance purposes, including deals with the Ministry of Labour and the Vietnamese Fatherland Front.

Led by Bui Ngoc Trung, ICOMM operates under HTC, one of Vietnam's private telecommunications firms.

IdeaForge

ideaForge Technology Limited, based in Mumbai, is a drone manufacturer and provider of surveillance UAVs for law enforcement. The company distributes the NETRA series, developed in collaboration with the Defence Research and Development Organisation (DRDO). These lightweight drones are designed for vertical takeoff and landing and are equipped with high-resolution daylight and thermal cameras. They are used primarily for real-time aerial surveillance including where GPS signals are weak or unavailable.

Indian police forces across multiple states, including Delhi, Mumbai, Punjab, Assam, Gujarat, Mangaluru, and Karnataka, have adopted ideaForge drones for operations that include crowd monitoring, protest surveillance, and nighttime patrols.

IDEMIA

IDEMIA, formerly known as Morpho, is a French multinational for advanced biometric and predictive analytics technologies often used for surveillance purposes. Its Traveler Analytics Suite is used to analyze passenger data, such as Passenger Name Records (PNR), at international borders.

In the United States, IDEMIA provides products to various federal and state government entities and is the leading provider in the issuance of driver's licenses. The company owns IdentoGO, which operates hundreds of storefronts offering electronic fingerprint capture and other identity-related services. The ACLU of Massachusetts reported that IDEMIA released a new video analytics product called Augmented Vision, enabling cameras to analyze people and their movements in real-time. The system includes algorithms capable of recognizing faces, silhouettes, vehicles, number plates,

and various objects. Notably, its automated "access control system" can identify a "person of interest," provide direct alerts, and automatically deny that person access to specific areas.

According to Amnesty International, its facial recognition technology was sold to the Shanghai Public Security Bureau, contributing to China's extensive surveillance infrastructure, including systems targeting Uyghurs and other minority groups in East Turkestan (renamed to Xinjiang by China.)

IMAS

The Information Monitoring and Analysis System (IMAS) is a platform to monitor and analyze mass media channels, including traditional and digital outlets, in Kazakhstan. The system offers tools for tracking information trends, analyzing public sentiment, and providing insights into media activity.

According to Freedom House's 2023 Freedom on the Net report, IMAS advertises a "monitoring system" that conducts social media surveillance." Its clients include the Prosecutor General's Office, the Ministry of Justice, and various local government administrations in Kazakhstan.

Indra Sistemas

Indra has been involved in providing surveillance and border control technologies that have been used in discriminatory practices, particularly in regions with stringent controls on migration and dissent. It is a provider of drones equipped with sensors, cameras, radars, AI and communication systems to monitor and control borders, as well as for intelligence gathering and target tracking.

The tag is: *misp-galaxy:surveillance-vendor="Indra Sistemas"*

Inex Technologies

Inex Technologies provides Automated License Plate Recognition (ALPR) systems for law enforcement agencies. Their cameras use neural network-based video analytics to process images on-board and output license plate numbers, reference images, and confidence scores. According to the company, this AI-powered processing enables real-time analysis at 40 FPS in their mobile systems, allowing for immediate identification and alerts on watchlisted vehicles. In 2006, Inex Technologies acquired Zamir Recognition Systems. They rebranded as INEX/ZAMIR while operating from headquarters in both Israel and the U.S, but the company currently goes by the name Inex Technologies.

Infinova

Infinova Corporation, headquartered in Monmouth Junction, New Jersey, is a global provider of advanced surveillance technologies, including CCTV systems, IP cameras, facial recognition systems, deep-learning algorithms, multi-angle recognition and AI-driven analytics. It’s heavily involved in China’s expansive surveillance programs, such as the "Sharp Eyes" platform and projects in regions like Xinjiang to target Uyghurs. Infinova deleted all articles about its Xinjiang projects from its Chinese website, though IPVM (The Authority On Physical Security Technology) retained copies.

Infinova has also been involved in major mass surveillance projects globally, including in countries like Kuwait, Saudi Arabia, Turkey, Mexico, India and the UAE.

Inkas

Canadian armoured vehicle manufacturer Inkas is a provider of surveillance and interception technologies through its Aerospace & Defense division, established in September 2021. This division markets a comprehensive catalogue of advanced interception systems, including Wi-Fi interception tools, IMSI-catchers, geolocation systems, and other interception products.

Inkas also has partnerships in Israel, where it collaborated with former Unit 8200 officer Eyal Avidov to expand into electronic systems integration and platform-mounted electro-optical systems. The company has supplied surveillance-enabled armoured vehicles to police forces in Nigeria, the UAE, Saudi Arabia, and beyond.

Innefu Labs

Innefu Labs, an Indian cybersecurity and artificial intelligence company, has faced scrutiny for its involvement in surveillance technologies and alleged links to spyware attacks. Amnesty International uncovered connections between Innefu Labs and the Donot Team, a notorious hacker group responsible for targeting activists with spyware. This spyware, used in attacks on a Togolese human rights defender, could access sensitive data, including photos, files, and encrypted messages.

The company also provides the facial recognition software AI Vision, used by police in several Indian states for surveillance purposes, including during protests. This technology, which incorporates gait and body analysis, has sparked debates about privacy and the potential for misuse in monitoring dissent. Their clients include the Central Reserve Police Force (CRPF) and the Border Security Force (BSF) in India.

Insanet

Insanet is an Israeli company that uses advertising technology to infiltrate devices and surveil users. Insanet reportedly collaborated with Candiru, an Israeli spyware manufacturer sanctioned in the US, to market their surveillance software, Sherlock, alongside Candiru's own spyware products. Unlike traditional spyware that exploits system vulnerabilities or requires user interaction, Sherlock embeds spyware into targeted advertisements. When these ads are displayed on a webpage viewed by the target, the spyware is silently installed on their device, including Windows computers, Android phones, and iPhones. Sherlock's capabilities include monitoring, data capture, and transmission,

Insanet also worked with Israeli cyber-intelligence, cloud infiltration specialist Paragon, which claimed to have the power to remotely break into encrypted instant messaging communications through its tool Graphite.

According to Haaretz, "the company is owned by former ranking members of the defense establishment, including a past head of the National Security Council, Dani Arditi." The same report by Haaretz also notes that "Insanet has succeeded in obtaining authorization from the Defense Ministry to sell their technology globally. It has already sold the capability to one country that is not a democracy."

The tag is: *misp-galaxy:surveillance-vendor="Insanet"*

Integrity Labs

Integrity Labs Ltd. is a private company established in December 2024 and based in Herzliya, Israel. The company is directed by Naftali Yoran. Integrity Labs Ltd. was created following the acquisition of Candiru's assets by U.S.-based investment firm Integrity Partners in a $30 million deal. This strategic move allowed Candiru's operations to continue under a new corporate identity, circumventing U.S. sanctions imposed in 2021 that had placed Candiru on the U.S. Entity List due to national security concerns.

Research by Recorded Future's Insikt Group revealed new infrastructure linked to Candiru's spyware, known as DevilsTongue. This infrastructure includes operational clusters in Hungary and Saudi Arabia, suggesting that the spyware continues to be active in these regions. Integrity Labs Ltd. was identified within Candiru's corporate network.

iOmniscient

iOmniscient is a developer of AI-driven surveillance technologies, offering monitoring solutions like facial recognition, behavioral analytics, and crowd management. Their technology has been deployed in over 50 countries. In Hong Kong, the company's AI tools were suspected to be used by police to identify individuals in crowds and match faces against databases during the 2019 pro-democracy protests. iOmniscient's technology is also employed by the Saudi Customs Department at the Al Hadithah border crossing between Saudi Arabia and Jordan. Its clients also include the Chinese army.

The company's facial recognition system claims to be highly advanced, capable of identifying and matching faces against databases even in crowded and uncontrolled environments. The system can track individuals across multiple non-overlapping cameras, providing continuous monitoring of their movements. The system integrates with video management tools, such as those provided by Cisco, to alert law enforcement in realtime. The company partnered with Cisco to install its facial recognition technology at the University of San Francisco.

iQ-Prison is iOmniscient's surveillance product for prisons.

IPS Intelligence

IPS (Intelligence Positioning Solutions) is an Italian company specializing in the development and provision of advanced communication monitoring tools and GPS tracking. IPS caters specifically to Homeland Security Departments and Intelligence Agencies, providing capabilities for intercepting, collecting, and extensively analyzing diverse data types. These include phone calls, Internet traffic, data from electronic surveillance devices, and information sourced from third-party databases.

Their operations cover a wide range of online platforms such as Facebook, Instagram, LinkedIn, YouTube, TikTok, Snapchat, Reddit, X (formerly Twitter) and GitHub. A customer in Tunisia leveraged IPS's services to conduct phishing and social engineering attacks, including IP tracking, demonstrating how the surveillance-for-hire firm provides a full spectrum of tools for invasive surveillance.

Ipsotek

Ipsotek, an Eviden business, provides AI-powered video analytics for law enforcement agencies. Its platform, VISuite AI, enables real-time detection of events while performing facial recognition, license plate recognition, and crowd monitoring. The patented “Tag and Track” system allows police to follow individuals or vehicles across multiple camera feeds. The company claims its products are widely adopted by police agencies worldwide.

In 2021, it was acquired by Atos, a multinational information technology (IT) service and consulting company headquartered in France.

Iskra Technologies

Iskra Technologies, formerly known as IskraUralTEL, is a Russian company that provides communication equipment, digital platforms, and automation systems that facilitate surveillance.

In 2013, Privacy International reported that IskraUralTEL had developed at least three components of SORM (System for Operative Investigative Activities), a Russian state-mandated surveillance system. Historical documentation from Iskratel in 2017 also suggests involvement in such systems.

Iskra Technologies also provides products for interception. Specifically, their Data Network Lawful Interception Solution enables the monitoring and interception of communications across various networks, including fixed, mobile, and broadband. This supports real-time data collection, processing, and delivery to law enforcement agencies.

Jacobs

Jacobs Technology is a provider of surveillance tools, including cell-site simulators (CSS), to law enforcement and intelligence agencies. These devices, often referred to as "Stingrays," allow authorities to intercept cell phone data and track locations covertly. Jacobs, which acquired the manufacturer KeyW in 2019, has deployed over 300 such simulators globally, including in the U.S., Europe, and Australia.

Jacobs' simulators are designed for covert use, often mounted in vehicles for mobile deployment. They support cellular and Wi-Fi data collection across 2G to 5G networks and are expandable for future capabilities.

Jingwang Weishi

Jingwang Weishi is a mobile application designed by Shanghai Landasoft Data Technology Inc. that is utilized for content control purposes, notably by authorities in Xinjiang, China. Residents are required to install the JingWang app, which scans devices for specific files. Cybersecurity researchers found that the app has poor security practices, transferring data without encryption and sending sensitive device information and file metadata to a remote server in China. The app scans for files using MD5 hashes and threatens users with detention for not complying.

Jouav

Jouav is a Chinese manufacturer of aerial surveillance technologies. Its aircraft, including the CW-15, CW-25E, CW-30E, and CW-80E models, are designed with vertical take-off and landing capabilities and can operate for up to eight hours with a range of roughly 200 km. These drones include features such as high-resolution EO/IR cameras and LiDAR sensors for real-time surveillance and automated tracking of targets. They are typically used by Chinese authorities for border monitoring.

Its founders, Ren Bin and Wang Chen, were previously officers in the People's Liberation Army's General Armaments Department.

JSI Telecom

JSI Telecom is a surveillance and analytics company. It holds significant contracts with U.S. federal agencies such as U.S. Immigration and Customs Enforcement (ICE), and provides support for the agency's "Title III digital collection system," enabling the interception of wire, oral, and electronic communications, including calls, texts, and emails. Since 2014, JSI Telecom has facilitated ICE's use of Title III orders, which can be issued for a wide range of purposes. In addition to its work with ICE, JSI Telecom also holds contracts with the FBI and has been implicated in a clandestine surveillance program involving multiple police forces across Ontario, Canada.

According to its website, JSI Telecom provides services to over 30 countries worldwide. In addition to its headquarters in Canada, it has offices in the U.S, Germany, and Australia.

Kaseware

Kaseware is a Denver-based software company that facilitates surveillance activities for law enforcement and other agencies. Its co-founders helped build the FBI's investigation management solution in the U.S. Partnered with ShadowDragon and Microsoft, Kaseware provides a centralized investigative platform that integrates diverse data sources, including open-source intelligence (OSINT) from social media, websites, and other online platforms. This platform supports activities such as behavior analysis, predictive policing, and mapping the social graph and relationships of targets.

Kaseware's platform is used alongside ShadowDragon tools like SocialNet and OIMonitor, which allow for real-time monitoring of individuals across over 120 online platforms, including social media, dating apps, and the dark web.

Kedacom

Kedacom is a company headquartered in Suzhou, Jiangsu, China and which specializes in surveillance and video technology. It has been actively involved in policing services through its advanced surveillance systems. Kedacom's technology is prominently used by the Dubai Police Department, where it has introduced a solution that combines mobile technology with artificial intelligence. This includes high-performance front-end cameras, artificial intelligence systems, and various devices such as body-worn cameras, 4G PTZ cameras, in-vehicle NVRs, and control pads. These components are integrated with a video surveillance platform to enable real-time video and audio acquisition, storage, and review.

The technology works by utilizing facial and vehicle recognition capabilities, allowing for real-time video transmission to police command centers. The system also supports deep learning algorithms and big data analysis.

Kedacom also offers the Falcon Human Recognition System, supporting up to 500,000 cameras and a face/human detection comparison library of up to 10 million entries, according to the company's official website. It boasts a face recognition accuracy of up to 98% and supports various camera types, including Kedacom's own and third-party IP cameras.

Key Technologies

Key Technologies, a company operating in the UAE and Greece, develops border surveillance and interception technologies. Founded in 2019 by Ferit Bonfil, a former expert in interception

countermeasures, the company has gained support from Abu Dhabi Catalyst Partners (ADCP), a joint venture between Mubadala Investment Company, a UAE-based sovereign wealth fund, and Falcon Edge Capital, a New York-based alternative asset manager which has rebranded itself as Alpha Wave Global.

According to Intelligence Online, Key Technologies showcased its Theia border monitoring system at a Milipol security trade fair in Paris in 2021. Theia features advanced capabilities, including a German-engineered SX800 optically stabilized lens, night vision with infrared laser illumination, geolocation, and telemetry tools. Notably, the system avoids restrictions under the US ITAR regulations and can be remotely controlled via 4G/5G networks or IP Mesh radio technology from Domo Tactical Communications (DTC).

Kommlabs

Kommlabs is a company in India that provides a range of products including mass interception systems, GSM geolocation finders, data mining and analytics platforms. Its products include VerbaTRACK, which enables the real-time tracking of any mobile device that is switched on and the ability to monitor its location 24/7. It also includes VerbaPROBE, which enables intelligence agencies to gather information from a vast amount of data using analytical tools like multi-lingual OCR, free text search, speaker and language identification and advanced data mining techniques. Another product, VerbaCENTRE, is a monitoring centre solution that enables law enforcement agencies to intercept, monitor and analyze a target's voice, SMS, location and internet communications. It also offers ReveaLINX as a product, which is an interactive visual analytical tool that finds invisible relationships and exposes networks across millions of records from multiple databases, such as social associations of a target, the time and locations of all their whereabouts, and related information from cell tower dumps. The company claims to have offices in Asia, the Middle East and Africa.

KoSpy

KoSpy is a malicious spyware attributed to the North Korean state-sponsored hacking group APT37 (also known as Reaper). This sophisticated malware was found on the Google Play Store, embedded in seemingly legitimate Android apps. KoSpy is designed to covertly collect sensitive user data, including including SMS text messages, call logs, the device's location data, files and folders on the device, user-entered keystrokes, Wi-Fi network details, and a list of installed apps, while operating undetected. KoSpy can also record audio, take pictures with the phone's cameras, and capture screenshots of the screen in use.

L3Harris

L3Harris is a US defense contractor company. Formed through the merger of L3 Technologies and Harris Corporation in 2019, L3Harris is known for its products in communication systems, avionics, space and airborne systems, and defense electronics. The company's communication and surveillance products are used by law enforcement agencies for monitoring and intelligence operations. L3Harris is also a producer of surveillance tools like Stingray cell-site simulators. These devices mimic cell towers to intercept mobile phone signals, enabling the collection of sensitive

data such as call metadata, location information, and, with additional software, even the content of communications.

L3Harris was in talks to buy ownership of Pegasus software. As of February 2024, the company was in "mature talks" to set up a regional HQ in Saudi Arabia.

Landasoft

Landasoft is a Shanghai-based private defense company and technology firm that contributes to China's mass surveillance infrastructure, particularly in the Xinjiang province. An Associated Press investigation revealed that the firm, which was a former partner of IBM, replicated IBM's i2 police analytics and launched its own platform to power the Integrated Joint Operations Platform (IJOP) in Xinjiang.

Landasoft deployed software that scraped data from millions of cameras, police outposts, and personal records to build risk dossiers. The system categorized individuals using tags like "studied abroad" or "went on pilgrimage," computed risk scores, and enabled automatic "Push Alerts" to trigger detentions based on flawed predictions, often without human oversight. In one week in 2017 alone, IJOP flagged 24,412 people as "suspicious," leading to widespread detentions, with Uyghurs as a primary target.

The tag is: *misp-galaxy:surveillance-vendor="Landasoft"*

Leo Impact

Leo Impact is an Indian cyber intelligence firm based in Rajasthan, developing both defensive and offensive cybersecurity technologies. Leo Impact has also been linked to controversial surveillance activities. Its now-defunct website, "SpyPhoneWorld.com," openly marketed surveillance software capable of remotely monitoring phones, targeting use cases like tracking partners or employees.

The tag is: *misp-galaxy:surveillance-vendor="Leo Impact"*

Leonardo

Leonardo S.p.A. is an Italian defense company that provides various surveillance technologies across multiple domains, including air, land, sea, and space, primarily for military and government operations. Its portfolio includes mobile surveillance systems, which combine radar sensors, optronics, and command-and-control facilities for real-time monitoring. Their electro-optical and infrared systems enable tracking of medium- to long-range targets. It's also a developer of airborne mission management systems, such as ATOS, which integrates multiple sensors for surveillance purposes.

The tag is: *misp-galaxy:surveillance-vendor="Leonardo"*

LexisNexis

LexisNexis' Accurint product collects a wide range of data from both public and non-public sources and offers them for sale primarily to government agencies and law enforcement. The platform compiles billions of records from sources such as government databases, utility bills, phone records, license plate tracking and medical records. It also integrates analytics tools like link analysis, detailed location mapping, and pattern recognition.

Accurint is widely used by agencies such as U.S. Immigration and Customs Enforcement (ICE) and Customs and Border Protection (CBP) for surveillance purposes, including tracking individuals and conducting deportation raids.

LexisNexis also integrates facial recognition technology into its monitoring tools, enabling law enforcement and government agencies to identify individuals and analyze images as part of their surveillance and data-gathering efforts.

LexisNexis is a wholly owned subsidiary of RELX PLC, a global information and analytics company headquartered in London.

The tag is: *misp-galaxy:surveillance-vendor="LexisNexis"*

LianSpy

LianSpy disguises itself as system applications or financial services like the Alipay digital payments app. When the spyware operates as a system app, it automatically gains the necessary permissions for further exploitation, requesting access to screen overlay, notifications, background activity, contacts, and call logs. Once activated, LianSpy hides its icon from the home screen and runs silently in the background with administrator privileges. It discreetly monitors user activity by intercepting call logs, sending a list of installed applications to the attackers' server, and recording the smartphone’s screen, particularly during messaging activities. According to researchers, LianSpy is a post-exploitation malware, indicating that the attackers either exploited an unknown vulnerability in Android devices or gained physical access to the victims' smartphones to modify the firmware.

The tag is: *misp-galaxy:surveillance-vendor="LianSpy"*

Logically

Logically, a UK-based artificial intelligence company, has been involved in government contracts for monitoring and analyzing social media content. The company has received over £1.2 million in funding from the UK government to identify and flag specific content online it deems to be misinformation or disinformation. Using AI, Logically processes data from hundreds of thousands

of media sources and public posts on major social media platforms.

Logically's tools were initially tested during elections in India and later expanded to support other government efforts. In the United States, the Washington Secretary of State extended a contract with Logically to monitor social media posts concerning elections. The Wall Street Journal reported in 2021 that the Department of Homeland Security (DHS) had engaged in at least preliminary discussions with Logically.

Massive Blue

Massive Blue, a New York-based company, has developed a surveillance tool called Overwatch, marketed as an "AI-powered force multiplier for public safety." This technology deploys AI-generated virtual personas designed to infiltrate online spaces. Its stated use cases include monitoring "college protesters," "radicalized" activists, among others. The AI bots can engage in conversations, join groups, and monitor discussions to gather intelligence on specific targets or communities. The bots are also programmed to mimic human behavior, making them difficult to distinguish from real users.

Police departments, particularly near the U.S.-Mexico border, have invested heavily in this tool.

Megvii

Megvii, also known as Face++, is a leading facial recognition company in China. Its technology has been linked to the mass surveillance and arbitrary detention of Uyghurs in East Turkistan (renamed Xinjiang by China). Megvii has exported its facial recognition software to other countries, including Thailand and Pakistan.

In compliance with Chinese regulations, Megvii is used to authenticate user identities on social platforms. Megvii’s proprietary deep learning algorithm, called Brain++, continuously improves the system’s accuracy and performance.

Megvii’s technology is also used to power China’s Skynet system, which monitors public spaces with hundreds of millions of cameras.

Meiya Pico

Xiamen Meiya Pico Information Co., Ltd. (aka Meiya Pico) provides surveillance technologies for use by the Chinese authorities. Meiya Pico has developed a mobile application designed to track image and audio files, location data, and messages on ordinary citizens' cellphones. The company has also collaborated with other entities to develop a transcription and translation tool for the Uyghur language to enable authorities to scan electronic devices for criminal content. In 2018, residents of East Turkistan (renamed Xinjiang by China) were required to download a desktop version of Meiya Pico's surveillance software so authorities could monitor for "illicit activity". Its monitoring mobile app is called MFSocket. They recently changed their corporate name to SDIC Intelligence Xiamen.

The tag is: *misp-galaxy:surveillance-vendor="Meiya Pico"*

Meltwater

Meltwater is a Norwegian media intelligence platform that provides tools for monitoring and

analyzing social media, news, blogs, and other online content. It is now headquartered in San Francisco, California. Meltwater's capabilities include real-time social media monitoring, keyword tracking, and sentiment analysis.

Meltwater has also been used by law enforcement agencies for surveillance purposes. Police departments have reportedly utilized the platform to monitor social media activity related to protests and against specific targets and communities.

The company has secured contracts with Canadian federal agencies for media monitoring services. In 2015, the UK government contracted Meltwater, among other firms, to monitor public social media activity. In 2021, Singapore's Ministry of Communications and Information appointed Meltwater, to provide media monitoring and online analytics services for all government agencies. Meltwater also operates multiple offices in India, including locations in Delhi and Bengaluru.

Memento Labs

Memento Labs is a company that acquired the infamous spyware vendor Hacking Team, which sold its advanced surveillance technology, called Remote Control System (RCS), to governments and dictatorships worldwide. When researchers began to uncover information about Hacking Team's operations, the primary targets were human rights activists and journalists. Hacking Team's former chairman, Paolo Lezzi, became the owner of Memento Labs and its parent company, InTheCyber. Memento Labs develops various snooping products, such as KRAIT, a surveillance tool that can silently infect any Android device without the target's knowledge. It uses a "trusted implant" to appear as a legitimate source, making it easy to trick users into installing it. Once installed, KRAIT can steal passwords, monitor the device's location, microphone, camera, calls, and messages, all while hiding its activity through trusted online services. Another product, RCS X, is the latest version of a powerful spyware that has been used against journalists and human rights activists since 2012. It can infect almost any device, including macOS, Linux, Android, iOS, and BlackBerry, using security vulnerabilities. Once installed, RCS X allows hackers to control microphones, cameras, and take screenshots, while managing all infections from a single console.

At a monitoring conference in Dubai, Memento Labs introduced two new tools: MoniTOR and PrevenTer. PrevenTer is designed for speech recognition and transcribing call recordings. MoniTOR is aimed at helping law enforcement track activities by attempting to exploit any technical vulnerabilities to bypass anonymization methods used by the Tor network. However, these tools were not developed by the company itself, it was developed via a research collaboration with the University of Applied Sciences and Arts of Southern Switzerland (SUPSI) and funded by the Swiss Agency for Innovation Promotion, Innosuisse. SUPSI and Memento Labs' parent company, In The Cyber, have contractual agreements to jointly develop software products.

MER Group

MER Group develops and sells a range of surveillance and cyber intelligence solutions, including tools for intercepting communications, extracting data from devices, and monitoring online activities. One of the company’s flagship surveillance projects is the ‘Mabat 2000’ project in the Old City in occupied East Jerusalem. The project includes an array of about 400 CCTV cameras deployed throughout the Old City and linked to a police Command and Control center that monitors residents’ movements 24/7. In addition, the company’s surveillance cameras have been installed at the Beit Iba checkpoint, the Sha’ar Ephraim checkpoint and at the Anatot army base in the occupied West Bank.

Mühlbauer

Mühlbauer, a German technology company, became Uganda's first biometric ID system provider in 2010 following a meeting between President Museveni and the German ambassador. The $80 million contract was controversial as it bypassed normal government procurement rules by avoiding a competitive bidding process. The company played a significant role in expanding Uganda's biometric identity coverage, registering approximately 5 million citizens in just 6 weeks. Their system provided ID cards and digital identities to Ugandan citizens.

While Mühlbauer's technology was ostensibly implemented for legitimate identification purposes, extensive documentation and interviews gathered by Bloomberg and nonprofit investigative newsroom Lighthouse Reports reveal it has evolved into a sophisticated surveillance tool used to monitor politicians, journalists, human rights advocates, and ordinary citizens in Uganda.

Mobilewalla

Mobilewalla is a data broker and consumer intelligence platform that aggregates and analyzes large amounts of consumer data. It was founded in Singapore and later moved its headquarters to Atlanta, Georgia, U.S.

Mobilewalla collected over 500 million unique consumer advertising identifiers paired with precise location data, often without consumer knowledge or consent. This data revealed sensitive information, such as visits to healthcare facilities, religious institutions, and political events. Mobilewalla also tracked residents of domestic abuse shelters and purposefully tracked protesters in 2020.

In addition, Mobilewalla admitted that it supplied data used by the U.S Department of Homeland Security, the U.S Internal Revenue Service (IRS), and the U.S. military for warrantless device tracking domestically and internationally.

The Federal Trade Commission (FTC) stated that Mobilewalla failed to anonymize this data. In response to these practices, the FTC finalized an order in 2025 banning Mobilewalla from selling sensitive location data and collecting consumer data.

Mollitiam Industries

Mollitiam Industries is a Spanish cybersecurity and surveillance company that develops intelligence and monitoring solutions. The company provides various tools with intelligence gathering and surveillance capabilities for both government and private sector clients. Those who have bought its surveillance products include the Colombian armed forces, which have used them to illegally spy on supreme court judges, politicians, journalists, and journalists' sources. Colombian targets have included Alejandro Santos, the editor of the news magazine Semana, and some of his reporters after they published articles about crimes committed by the members of the military. In 2019 alone, Colombia's military reportedly spent $800,000 on spyware from Mollitiam Industries.

MSAB

MSAB is a Swedish forensic technology company. Its software, XRY, which can decrypt passwords and recover deleted data, was reportedly used by Hong Kong police in 2020 to access pro-democracy activist Joshua Wong's phone in under an hour. Leaked documents in 2021 showed that Myanmar's military junta used MSAB's technology to extract data from phones, including deleted content. In the U.S, the San Diego Police Department employs MSAB's XRY software to extract data from mobile devices in investigations. It's also used by the FBI and U.S. Customs and Border Protection (CPB), among other government agencies.

MSAB developed tools for CPB to gather information from vehicles at border crossings by extracting data from car infotainment systems. These systems store a wealth of information, including call logs, text messages, GPS locations, and paired device data.

Its reseller in Hong Kong is S-Tech, which also sells surveillance tools from Oxygen Forensics and BlackBag (acquired by Cellebrite in 2020.)

Naung Yoe Technologies

Naung Yoe Technologies Co., Ltd. is a Yangon-based company that distributes surveillance products, system integration, and equipment provision. Since the 2021 military coup, Naung Yoe Technologies has been involved in the procurement and installation of surveillance technologies across Myanmar. The company has been awarded tenders to install Chinese-made CCTV cameras equipped with facial recognition capabilities in several cities, including Naypyidaw. These projects are part of the junta's "safe city" initiatives.

The surveillance systems supplied by Naung Yoe Technologies are sourced from Chinese manufacturers such as Zhejiang Dahua Technology, Huawei Technologies Co. Ltd., and Hikvision.

A source close to the company disclosed that Naung Yoe Technologies employed former generals, which may have influenced its success in securing government contracts, including the installation of CCTV networks and command-and-control centers in Naypyidaw. In March 2023, the company was added to the U.S. Department of Commerce's Entity List, which restricts access to U.S.-origin items, software, and technology.

The tag is: *misp-galaxy:surveillance-vendor="Naung Yoe Technologies"*

Near

Data intelligence company Near was originally founded in Singapore in 2012 and later relocated to Pasadena, California. In 2021, data broker Near claimed to have location data on 1.6 billion people, which raised additional concerns when the company filed for bankruptcy in 2022. The data's potential sale to another company, including sensitive information from locations like abortion clinics, alarmed many human rights and privacy advocates. Near's privacy policy states that all collected data can be conveyed to prospective new owners, should the business be sold. Near sold data to the U.S government and claimed otherwise on its website, with no privacy safeguards in place until 2022. The sale of location data without informed consent continued until at least October 2023.

NeoBit

NeoBit, a Russian company headquartered in St. Petersburg, is involved in surveillance and cyber operations on behalf of the Russian government. The company is behind the development of Vepr, a system designed to monitor and predict "information tension points" on the internet. This project, commissioned by Roskomnadzor (Russia’s internet censorship agency), aims to analyze online

content, including tone, aggression, and repost metrics, to identify perceived threats such as criticism of authorities, "LGBT propaganda," and other topics deemed undesirable by the state. Vepr is part of a broader initiative, the Clean Internet project, which seeks to surveil 100% of Russia's online activity using advanced neural networks and bot farms capable of infiltrating closed social media groups.

NeoBit has reportedly collaborated with Huawei, the Chinese tech giant, by supplying expertise in artificial intelligence fields such as machine learning, behavioral analysis, and anomaly detection. Huawei has also recruited researchers from NeoBit and other Russian firms.

The company was sanctioned by the United States in 2021 for its suspected ties to Russia's three main intelligence services: the FSB, SVR, and GRU. NeoBit is also a contractor for Russia's Ministry of Defense and the Federal Protective Service (FSO).

The tag is: *misp-galaxy:surveillance-vendor="NeoBit"*

Neurotechnology

Neurotechnology is a Lithuania-based company that develops biometric identification systems used by governments, law enforcement, and private-sector clients worldwide. Founded in 1990, the company's suite of products include facial recognition, fingerprint, iris, and voice recognition technologies, and has supplied its algorithms to national ID programs, border control systems, and police agencies across multiple countries.

Its MegaMatcher and VeriLook software is capable of performing large-scale biometric matching. Law enforcement entities have deployed Neurotechnology's tools for investigations, target identification, and crowd monitoring, often in combination with surveillance footage or photo databases.

Nexign

Nexign, formerly known as Peter-Service, is a Russian company that provides surveillance software and monitoring services for telecommunications companies. The company is part of USM Telecom, owned by Kremlin insider Alisher Usmanov.

According to its website, Nexign's products have been delivered to 12 countries and includes the surveillance company Protei as a partner.

The tag is: *misp-galaxy:surveillance-vendor="Nexign"*

Niagara Networks

Niagara Networks is a Silicon Valley–based company that develops network visibility and traffic delivery technologies. Their products include network TAPs (traffic access points), packet brokers, bypass switches, inline bypass elements, and visibility orchestration tools. A report by Amnesty International has identified Niagara Networks as one of the foreign suppliers whose hardware or software is used in Pakistan's "Web Monitoring System (WMS 2.0)", a state-firewall network intended to monitor, filter, or block internet traffic.

Niagara Networks distributes its products via a company called Softprom, an IT distributor founded in 1999, operating primarily in Central & Eastern Europe, the Caucasus, Central Asia, and the CIS (Commonwealth of Independent States). It has a similar distributor relationship with CLICO, an IT distribution service founded in 1991 and based in Poland.

NICE Systems Ltd

NICE offers surveillance and analytics tools that enable agencies to monitor and analyze large volumes of data, especially to law enforcement agencies. These tools include advanced video surveillance systems, voice and data analytics software, and communication interception capabilities. NICE is also a longtime collaborator of the Milan-based Hacking Team. According to a Buzzfeed investigation based on emails leaked by Wikileaks, the two companies exchanged nearly 3,000 emails between 2010 and 2015, discussing business opportunities in countries such as

Uganda, Mexico, Colombia, Israel, and Finland. NICE is one of Hacking Team's largest partners, frequently acting as an intermediary, connecting Hacking Team with state police and intelligence agencies seeking surveillance tools and advanced malware capabilities.

NICE Actimize, a subsidiary of NICE Systems, has developed SURVEIL-X Behaviour, an AI-powered solution designed to provide organizations with a comprehensive behavioral profile of employees. Integrated into the SURVEIL-X Holistic Employee Conduct Surveillance suite, this tool actively surveils employees and analyzes detailed data from hundreds of sources, such as HR systems, customer complaints, and access control logs.

NICE sold its Physical Security Business Unit (PSBU) to private equity firm Battery Ventures for up to $100 million. The PSBU, rebranded as Qognify, specializes in video analytics and physical security information management. This followed an earlier sale of its cyber and intelligence division to Elbit Systems.

Nightingale

Nightingale Security is a developer of autonomous surveillance drones headquartered in Newark, California, United States. Their drones, known as Blackbirds, are equipped with advanced features like autonomous takeoff, landing, and recharging, as well as thermal imaging and AI-based threat detection. These drones can perform scheduled patrols, respond to alarms and provide live video feeds to its operators.

Nightingale's surveillance drones have been deployed in Saudi Arabia and is also used by police agencies in several countries around the world.

Nodeflux

Nodeflux is Indonesia's first and largest Vision AI company, founded in 2016. Its primary platform, VisionAIre, delivers AI-powered video analytics for applications such as facial recognition, license plate recognition (LPR), and activity detection. These technologies are utilized by Indonesia's law enforcement agencies in smart city initiatives and for surveillance purposes.

The Indonesian National Police (POLRI) and the Republic of Indonesia State Intelligence Agency (BIN) have adopted Nodeflux's AI surveillance technologies since 2017.

Nodeflux's technology integrates with national databases, such as the Department of Population and Civil Registration (DISDUKCAPIL), for identification and monitoring through CCTV networks in cities like Jakarta and Bandung . Their AI analytics also support Jakarta's smart city program. Nodeflux is listed as a Gold Partner in Intel's partner showcase. IBM and Nvidia are also listed amongst its collaborative partners.

Noldus Information Technology

Noldus Information Technology, a Dutch company, specializes in emotion recognition systems and digital surveillance technology. Their "FaceReader" software, which automatically analyzes facial expressions such as anger, happiness, sadness, surprise, and disgust, has been sold to public security and law enforcement institutions in China. The software has been used by Chinese universities with ties to the public security apparatus and police, as well as the Ministry of Public Security.

Amnesty International revealed that Noldus supplied its technology to at least two universities in Xinjiang between 2012 and 2018, including "The Observer XT" software to Shihezi University, which is administered by the Xinjiang Production and Construction Corps (XPCC). XPCC plays a key role in maintaining China's unification, social stability in Xinjiang, and in combating what the government labels as violent terrorist crimes. By 2012, it was already recognized that the Chinese government was conflating Uyghur cultural and religious practices with terrorism, and in the following years, technology for suppressing minorities in Xinjiang, particularly emotion and behavioral analysis systems, became a focus of Chinese authorities.

NotionTag

NotionTag is the developer of FaceTagr, an advanced facial recognition application designed for identity verification and video analytics. Adopted by the Chennai police since 2017, it uses computer vision to analyze CCTV footage for real-time object detection, zone monitoring, and suspect identification.

In addition, the company developed CoBuddy, a facial recognition app which was used by Tamil Nadu police during the COVID-19 pandemic to monitor individuals under quarantine, according to MediaNama. The app combined GPS geofencing and facial verification to ensure quarantined individuals remained within designated areas. The app also sent random prompts for face verification multiple times a day, alerting authorities if someone left the geofenced zone. It featured a centralized dashboard for real-time monitoring and heat maps of quarantined individuals.

NoviSpy

NoviSpy is a spyware discovered by Amnesty International. It was found on a Serbian journalist's phone, reportedly installed after the device was unlocked using a Cellebrite tool. NoviSpy operates through two applications, NoviSpyAdmin and NoviSpyAccess, which exploit Android's accessibility services to perform extensive surveillance. Its capabilities include capturing screenshots, exfiltrating files, tracking location, and remotely activating the device's microphone and camera. Installed via the Android Debug Bridge (adb), NoviSpy has been in development since at least 2018.

NtechLab

The Russian company NtechLab operates Russia's extensive biometric mass surveillance system. This system has reportedly facilitated numerous arbitrary arrests of Russian citizens identified through NtechLab's biometric recognition technology, often during peaceful demonstrations. In July 2023, the European Union imposed sanctions on NtechLab for its involvement in serious human rights violations in Russia.

NtechLab is also behind FindFace, a powerful facial recognition app that quickly gained popularity for its ability to identify individuals with high accuracy by comparing photos to profile pictures on

the Russian social networking site Vkontakte.

The company operates as a subsidiary of Rostec, a Russian state-owned corporation.

The tag is: *misp-galaxy:surveillance-vendor="NtechLab"*

Ntrepid

Ntrepid is a software company specializing in tools and solutions for online anonymity, intelligence gathering, and social network analysis. A subsidiary of Abraxas, a prominent contractor for the U.S. intelligence community and owned by Cubic, Ntrepid has played a major role in advancing the capabilities of U.S. military and intelligence operations. The company is best known for developing software that allows U.S. military personnel to create culturally and personally detailed false identities, enabling the infiltration of social networks in countries like Afghanistan and Iraq.

A Guardian investigation revealed that the U.S. Central Command (Centcom) granted a $2.76 million contract to Ntrepid to develop the "sock puppets" for manipulation and intelligence gathering.

The company’s Chief Technical Officer Lance Cottrell gave several training seminars at ISS World, the internet and telecommunications interception systems manufacturers’ conference that promotes surveillance products to governments. Cottrell is the creator of Anonymizer, which was acquired by Ntrepid’s parent company Abraxas in 2008.

Nuctech

Nuctech is a company in China that develops X-ray vehicle scanners. In late 2023, Nuctech introduced its X-ray vehicle scanners to the Serbian government, deploying them along the Serbian-Bulgarian border. The company has also sold its surveillance and scanning technologies to over 170 countries, including deployments at airports, seaports, and border crossings worldwide.

Nuctech Company is owned by Tsinghua Tongfang, which is under the control of the China National Nuclear Corporation (CNNC), a state-owned enterprise.

Octasic

Octasic, a Canadian company, is a developer of wireless communication technologies, including surveillance solutions such as IMSI catchers. These devices, often referred to as "Stingrays," are capable of intercepting mobile phone signals and tracking user locations by masquerading as legitimate cell towers. Octasic's Nyxcell V800 targets multiple frequency bands, including GSM (2G), CDMA2000 (3G), and LTE (4G), enabling comprehensive surveillance capabilities.

In 2019, sold IMSI catchers to the Rapid Action Battalion (RAB) in Bangladesh. Octasic's CEO, Sebastien Leblanc, confirmed that the Canadian government approved the export of these surveillance technologies to Bangladesh.

Octasic's involvement in the IMSI catcher market has expanded internationally, with the company exporting its surveillance tools to Europe via Cyprus. The company operates a research and development center in Bangalore, India, and has a sales office in Japan.

Oosto

Oosto is an Israeli company formerly known as AnyVision specializing in facial recognition and tracking technologies. AnyVision initially gained notoriety for its controversial use in monitoring the West Bank border and rebranded to Oosto in September 2021 after it faced significant backlash for its unethical business practices. Despite claims from Oosto that issues like racial bias have been mitigated, skepticism remains, particularly as the company pushes into even more contentious areas like behavior recognition.

In September 2020, AnyVision's/Oosto's shareholders partnered with Rafael Advanced Defense Systems Ltd. to form a joint venture named SightX. This new company, equally owned by AnyVision's shareholders and Rafael, focuses on developing advanced AI-recognition technologies for military use.

OryxLabs

OryxLabs is an Abu Dhabi-based cybersecurity firm. Established in 2020, the company specializes in DNS monitoring and zero-day exploit research. Under the leadership of Sumit Dhar, a former executive at DarkMatter and Digital14, OryxLabs has recruited a team of former spyware and surveillance tech developers, including veterans from Beacon Red and Connection Systems.

DarkMatter's surveillance activities included targeting journalists, activists, and dissidents with spyware and hacking tools. One of its operations, known as Project Raven, involved ex-U.S. intelligence operatives conducting cyber-espionage on behalf of the UAE. This included hacking into email accounts, tracking individuals' movements, and gathering private data. Journalists were specifically targeted to suppress dissent and monitor media activities critical of the UAE government.

In 2023, OryxLabs was acquired by EDGE, the defense conglomerate based in the UAE.

OSY Technologies

OSY Technologies is a Luxembourg-based company that serves as the parent organization of the NSO Group ecosystem. The company is part of a larger network primarily consisting of spyware and surveillance companies, often run by former Israeli intelligence officers. Both OSY Technologies and Q Cyber Technologies, which is also based in Luxembourg, have been named in lawsuits related to illegal hacking using the Pegasus spyware.

Michael Flynn, the former U.S. national security advisor, served on OSY Technologies' advisory board in 2016. This relationship coincided with NSO Group’s expansion into the U.S. market through the establishment of WestBridge Technologies in the D.C. region.

OT-Morpho

OT-Morpho, now known as French multinational IDEMIA, specializes in security and identity systems, including facial recognition and other biometric identification products. In 2015, the company was awarded a contract to supply facial recognition equipment directly to the Shanghai Public Security Bureau.

Kenya's opposition coalition has accused OT-Morpho of complicity in electoral fraud in Kenya.

Otesa

Otesa (Orion Technologies and Engineering Systems Africa) is a Namibian company that specializes in surveillance and biometric systems. Otesa developed the Automated Biometric Identification System (N-ABIS) for the Namibian Police Force, a project valued at N$40 million and completed over two years. This system integrates automated fingerprint identification and facial recognition technology, enabling rapid comparison of biometric data against millions of records in seconds. The system maintains an extensive database of fingerprints and facial images.

OurCrowd

OurCrowd is an Israeli company that facilitates startup investments. It helps fund and promote AI-powered surveillance tech, as well as tools like BriefCam, which develops and sells video analysis software that is capable of creating synopses of long clips and identifying and tracking objects and activities. It became the first Israeli VC registered by the Abu Dhabi Global Market to operate in the country. The UAE relies heavily on surveillance tech produced by Israeli startups and defense companies.

Outlogic

Outlogic, formerly known as X-Mode Social, is a data broker that collects and sells location data through specialized code embedded in over 100 mobile applications, including dating, music, weather, and Muslim prayer apps. On its former website, the company claimed to cover more than 25% of the adult U.S. population monthly. After being acquired by Digital Envoy in August 2021, the company has maintained significant government contracts, including with the IRS, Department of Homeland Security, and various military branches in the U.S.

In 2024, the Federal Trade Commission issued a settlement that prohibits Outlogic from selling or sharing location data that could be used to track individuals to healthcare facilities, domestic abuse shelters, or places of worship.

Oxygen Software

Oxygen Software, a Russia-based company, develops mobile forensics tools marketed under its U.S branch, Oxygen Forensics. These tools are primarily deployed by government agencies and are widely used for surveillance purposes. Their capabilities include extracting vast amounts of data from mobile devices, such as personal messages, call logs, location data, and other sensitive information. Governments, particularly in Central Asia, such as Kazakhstan and Uzbekistan, have reportedly used them to monitor activists, journalists, and political dissidents. In the U.S, its tools are used by the U.S Army, Department of Homeland Security (DHS), alongside other government agencies. According to an investigation by Gizmodo, U.S. school districts are also amongst its users. For example, Cypress-Fairbanks ISD in Texas confirmed using Oxygen Forensics' tools to extract data from students' phones for "evidentiary purposes."

Oxygen Software’s tools are often sold through regional resellers, such as Softline, which has offices in Kazakhstan, Tajikistan, Turkmenistan, and Uzbekistan.

Paladion

Paladion was an India-based company that develops surveillance tools for use by governments, law enforcement agencies, and corporations. Among its offerings is an SSL Interception and Decryption System, designed to perform covert man-in-the-middle attacks, enabling the monitoring of encrypted communications, including banking transactions and Gmail. Paladion marketed a link analysis tool that maps relationships between individuals, identifying key connections within groups for extended surveillance. This tool integrates with the client’s Internet Monitoring System (IMS), a scalable framework capable of nationwide surveillance, offering real-time analysis, long-

term data storage, and proactive detection of new targets for deep intelligence gathering.

Paladion maintained offices in India, the U.S, Oman, Saudi Arabia, United Arab Emirates and United Kingdom.

The company was acquired by Atos in 2020.

Palm Beach Networks

Palm Beach Networks (formerly known as Defense Prime) is a spyware company with roots in both the U.S. and Israel, operating out of Barcelona, Spain. According to an investigation by TechCrunch, the company specializes in offensive cybersecurity, including the development of zero-day exploits and spyware implants. It has undergone several rebrandings, transitioning from Defense Prime to Palm Beach Networks and later to Head and Tail, with overlapping executives across these entities.

According to Intelligence Online, the company's Israeli founders, Yigal Sharon and Yosef Aloni, previously worked for US investment fund Black Dragon Capital. The third founder is Yaacov Nir. The company's Chief Technology Officer, Alexey Levin, is a former researcher at NSO Group and Candiru, two Israeli spyware firms. Levin has been involved in recruiting top-tier Israeli talent, offering high salaries and relocation packages to Barcelona.

In 2023, it was negotiating to acquire intellectual property and government contracts from the Israeli cyber-intelligence firm Quadream, focusing on its contracts in Asia.

Pangiam

Pangiam is a Virginia-based technology company that develops identity management, biometrics, and AI-driven security solutions for border control, aviation, and government applications. Founded by former senior U.S. Department of Homeland Security officials, Pangiam has expanded through strategic acquisitions, including the facial recognition platform veriScan and computer vision firm Trueface. One of Pangiam's flagship initiatives is its collaboration with U.S. Customs and Border Protection (CBP) on the Anomaly Detection Algorithms (ADA) project. It has also implemented facial recognition systems at various transportation hubs.

In March 2024, BigBear.ai completed its acquisition of Pangiam for approximately $70 million in stock.

Passitora

Passitora, previously known as WiSpear, is a Cyprus-based company controlled by former Israeli

intelligence commander Tal Dilian. It sells advanced surveillance technology to governments worldwide. Despite a ban on Israeli intelligence and defense exports to Bangladesh, Passitora sold spyware to the country's National Telecommunication Monitoring Centre (NTMC), a branch of the Interior Ministry responsible for monitoring internet and social media. This technology enables interception of calls, texts, and internet traffic.

The company has faced scrutiny in the past, including a scandal in Cyprus involving its SpearHead system, which was used to extract private data from people's phones without their knowledge or consent.

Passitora is part of the Intellexa Alliance, a network of companies marketing and selling spyware globally.

The tag is: *misp-galaxy:surveillance-vendor="Passitora"*

Passware

Passware is a U.S-Russian cybersecurity company that develops encryption-cracking tools that have been widely used by U.S. government agencies, including Immigration and Customs Enforcement (ICE), since at least 2010. Passware's software can bypass encryption on systems like TrueCrypt and is designed to be user-friendly, even for non-technical users. It is often bundled with other forensic tools, such as those from Oxygen Forensics, for use by law enforcement and intelligence agencies. The company's primary engineering office is in Moscow, Russia.

The tag is: *misp-galaxy:surveillance-vendor="Passware"*

PathAR

PathAR is a technology company specializing in social media monitoring analytics for intelligence gathering, with its primary product, Dunami, being used by U.S government agencies like the FBI and U.S. Customs and Border Protection (CBP). Dunami mines data from platforms such as Twitter, Facebook, and Instagram to create detailed profiles of users and map networks of association.

The Chicago Public Schools (CPS) received a $2.2 million grant in 2014 from the U.S. Department of Justice's Comprehensive School Safety Initiative. Part of the grant was allocated to hire two intelligence analysts and to purchase Dunami, which was then used to monitor students' public social media activity. The program initially targeted 16 schools and later expanded to 24 schools, covering approximately 25,000 students.

The company is backed by In-Q-Tel, the CIA's venture capital arm.

The tag is: *misp-galaxy:surveillance-vendor="PathAR"*

Patternz

Patternz is an Israeli company that builds geolocation technology derived from advertising data (ADINT) with advanced spyware capabilities. Founded in 2019 by Yoad Gidron, a former technical director at Rafael Advanced Defense Systems, alongside Nimrod Schwartz and Rafi Ton of digital advertising firm NUVIAD, Patternz leverages Mobile Advertising ID (MAID) technology to track individuals' locations in real time and build comprehensive target profiles. This approach is often used to bypass the need for legal warrants and benefits from more flexible export regulations compared to traditional surveillance tools.

The company's platform not only enables precise tracking and profiling but can also issue alerts when a target reaches specific destinations. Patternz is reportedly working on even more advanced solutions, including the integration of spyware capabilities into the ad-tech stack, potentially deploying Trojans through advertising frameworks. In January 2024, the business development firm Improvate The Future (ITF) filed a lawsuit against Patternz for alleged non-payment of services. ITF, which boasts a high-profile advisory board including former Israeli cybersecurity chief Yigal Unna and several ex-prime ministers, had previously facilitated Patternz's participation in international cyber delegations.

Udi Doenyas, Patternz's technical director, is a former architect of NSO Group's Pegasus spyware and has been a key figure in the company's operations.

Pavo Group

Pavo Group is a Turkish company providing interception and threat intelligence services through its subsidiaries, such as InterProbe and Interdata, serving both military and government clients globally. Its capabilities include IMSI-catcher technology, exploiting undisclosed software vulnerabilities for intelligence purposes, cyber intelligence systems including data interception, and technologies for tracking and locating mobile devices.

Barzan Holdings, the strategic investment arm of Qatar's Ministry of Defense and the commercial gateway for the country's military defense industry, owns a stake in the company.

pcTattletale

pcTattletale was a remote surveillance app, commonly referred to as "stalkerware", designed to secretly track people without their knowledge. The app allowed the person who planted it to remotely view screenshots and private data from the victim's Android or Windows device from anywhere in the world. Although pcTattletale marketed itself as a tool for monitoring employees, it also openly promoted its use for spying on spouses and domestic partners without their consent. The spyware required physical access to the target's device for installation and could be quickly deployed with just one click. The company also offered a "We Do It For You" service to assist in installing the spyware on a target's computer. According to TechCrunch, pcTattletale was used to compromise the front desk check-in systems at several Wyndham hotels across the United States, exposing screenshots containing guest details and customer information. The company has since ceased operations after a data breach.

The tag is: *misp-galaxy:surveillance-vendor="pcTattletale"*

Pegasus Intelligence FZCO

Not to be confused with NSO Group's Pegasus spyware, Pegasus Intelligence FZCO is a Dubai-based technology broker founded in 2008, and which specializes in offering security solutions, signals intelligence, and cyber intelligence to military and government clients operating in "difficult environments." The company leverages a network of relationships with supposed subject matter and field experts. In 2023, Pegasus Intelligence partnered with Gedion to provide advanced surveillance equipment to primarily government clients in the Gulf Cooperation Council (GCC.) The company has also partnered with Cyabra, an OurCrowd portfolio company, in a collaboration which integrates Cyabra's advanced AI-powered social search engine into Pegasus Intelligence's offerings, for government and military agencies within the GCC.

PenLink

PenLink is a software company that develops communications surveillance and data analysis solutions for law enforcement. It has become a go-to resource for agencies monitoring users across various platforms, including Google, Facebook, and WhatsApp. Its federal clients in the U.S. include the FBI and U.S. Immigration and Customs Enforcement (ICE.) PenLink's flagship products, PLX and PenPoint, enable law enforcement to collect and analyze large amounts of data, including social media interactions and telecommunications records.

In 2022, PenLink acquired GeoTime, which develops data collection and analysis software, and in 2023, it acquired the Israeli surveillance company Cobwebs Technologies, which develops software that aggregates data from phones and social media, converting it into intelligence.

In October 2025, The Washington Post reported that PenLink supplied ICE with Weblocs, a cellphone location tracking system that allows the agency to monitor individuals' movements without obtaining a court warrant.

Perceptics

Perceptics, a Tennessee-based subcontractor, became widely known after a hack exposed sensitive data, including license plate images and drivers' photos, collected by their license plate readers for U.S. Customs and Border Protection (CBP). Perceptics has also faced criticism for its role in gathering and analyzing location data, particularly in border communities. Internal emails reveal that Perceptics engaged in controversial trials combining license plate readers with facial recognition technology, and lobbied to influence privacy legislation while downplaying their involvement in data use. The company also transferred license plate and traveler images to its own privately owned network, causing it to be suspended by CBP.

Percepto

Percepto is an Israeli company that develops autonomous surveillance and monitoring solutions. Its primary platform, Percepto AIM, integrates autonomous drones and ground robots to perform continuous monitoring. It's also the developer of Sparrow I, a fully autonomous drone with defense applications. These systems use AI and computer vision to provide real-time intelligence. The company's Chief Commercial Officer, Ariel Avitan, claimed the company's technology is heavily influenced by Israel's advanced defense ecosystem. Percepto's technology have also been purchased by other countries and their homeland security departments.

Phunware

Phunware Inc. is a San Diego based that develops mobile software and blockchain solutions. Its mobile applications are designed for advertising, offering features like personalized ad targeting, location-based tracking, and cryptocurrency-powered brand loyalty programs. The firm built the official Trump 2020 re-election campaign. This app enabled the campaign to collect extensive personal data from users, including location information, contact lists, and behavioral patterns, facilitating targeted political advertising and fundraising efforts. The company's technology, which includes geofencing and data mining capabilities, allowed the campaign to monitor supporter movements and interactions.

PicSix

PicSix, also known as P6, is an Israeli cyber surveillance company based in Even Yehuda and run by former Israeli intelligence agents. It specializes in mobile interception technology. Their flagship product, P6Intercept, enables mass surveillance of hundreds of mobile phones simultaneously within its operational range.

An Al Jazeera investigation uncovered that Bangladesh's Directorate General of Forces Intelligence

(DGFI) acquired P6Intercept through an elaborate scheme designed to obscure the transaction's true nature. The deal involved multiple intermediaries: Sovereign Systems, a Singapore-based company, facilitated the purchase in Hungary, while James Moloney, an Irish national based in Bangkok, served as a middleman. To obscure the product's Israeli origin, the contract falsely listed Hungary as the country of manufacture. This arrangement allowed PicSix to conduct business with countries that typically avoid direct dealings with Israel.

During product demonstrations to Bangladeshi intelligence officials, PicSix representatives reportedly conducted unauthorized phone interceptions in Hungary.

Another notable product in their lineup is P6-FI5, a portable interception system that creates deceptive cell towers compatible with GSM, 3G, and 4G networks. This device employs a sophisticated strategy to bypass encryption: it deliberately disrupts encrypted applications on target devices, forcing users to switch to less secure, easily interceptable communication methods. Additionally, the system can deploy malware to any device connected to its counterfeit cell tower.

PKI Electronic Intelligence

PKI Electronic Intelligence, headquartered in Germany, is a developer of advanced surveillance and intelligence gathering technologies tailored for law enforcement and government agencies. Among their offerings is the PKI 1650 IMSI-Catcher, a device designed to track individuals by identifying their mobile phone identities. According to their website, this system allows multiple officers to monitor information both on-site and remotely, providing real-time data and logging capabilities for intelligence purposes.

Their products also include GSM cellular monitoring systems, long range WiFi interception, WiFi clone systems and audio surveillance equipment.

PowerSchool

PowerSchool is a provider of educational technology that collects and analyzes data on over 45 million K-12 students, representing 75% of students in North Africa. The company gathers extensive information, including demographic details, citizenship status, religious affiliation, disciplinary records, medical diagnoses, and family structure. This data is used to power predictive analytics, such as risk-scoring algorithms that assess student success based on factors like family wealth. PowerSchool's acquisitions, including Naviance, Kickboard, and Hoonuit, have expanded its reach into areas like college preparation, behavioral tracking, predictive risk scoring, and additional forms of student monitoring and surveillance.

In October 2024, PowerSchool was acquired by Bain Capital in a $5.6 billion deal.

Predicio

Predicio is a France-based company and provider of location data tracking and analytics. It collects granular location data by paying app developers for access to user data through its software development kit (SDK) called "Telescope." This data is then sold to various clients, including government agencies and private organizations. Reports indicate that Predicio's data has been part of a supply chain used by contractors working with U.S government contractors that service U.S. Immigration and Customs Enforcement (ICE) and the FBI.

Primer

Primer is a military-focused artificial intelligence company designed to support the "next-generation warfighter." It develops advanced AI solutions for mission planning, asset tracking, intelligence operations, and real-time threat detection. Its technology is capable of analyzing and synthesizing data from both classified and public sources, including surveillance, social media, and news outlets, to provide detailed intelligence for defense operations.

Primer is partnered with Palantir, a leading data analytics company, through Palantir's FedStart program. The program by Palantir offers a platform that allows companies, particularly startups, to quickly deploy their software to the US federal government and its various agencies with minimal compliance requirements.

The company's federal advisory board members include Sue Gordon, former principal deputy of national intelligence, Collin Green, a retired U.S. Navy vice admiral, and Daniel Simpson, a retired

U.S. Air Force major general who was also assistant deputy chief of staff for intelligence, surveillance and reconnaissance.

Qosmos

Qosmos was a French technology company that developed Deep Packet Inspection (DPI) software. It has faced significant scrutiny for reportedly supplying surveillance tools to oppressive regimes, including Bashar al-Assad's government in Syria, confirmed by several investigations. The company's software is capable of monitoring internet traffic, which can be used to track dissidents and suppress opposition.

In 2012, French authorities opened a judicial investigation into Qosmos for its potential complicity in crimes against humanity. The company denied selling its products directly to the Assad government but faced accusations of indirectly enabling surveillance through intermediaries. Advocacy groups and human rights organizations have criticized Qosmos for failing to ensure its technology was not misused.

In 2016, it was acquired by Swedish company ENEA.

QuaDream

QuaDream Ltd is an Israeli company that specialises in the development and sale of advanced digital offensive technology to government clients. The company is best known for its spyware marketed under the name “Reign”, which, like NSO Group’s Pegasus spyware, reportedly utilises zero-click exploits to hack into target devices. It was founded in 2014 by a group including two former NSO Group employees, Guy Geva, and Nimrod Reznik. In 2017, a company named InReach was established in Cyprus specifically to promote QuaDream products, such as Reign, outside of Israel. QuaDream utilized InReach to sell its products to its customers in order to bypass Israeli export controls. Many key employees of both InReach and QuaDream have previously worked for NSO Group, Verint, and UTX Technologies.

Rank One Computing

Rank One Computing (ROC) is a U.S.-based provider of facial recognition and multimodal biometric

technologies, used by government, defense, and law enforcement agencies. Capabilities of their products include facial recognition, fingerprint, and iris recognition, alongside AI-driven video analytics. They also provide license plate recognition tools. The company has been linked to bias and errors in facial recognition, with studies showing higher error rates for individuals with darker skin tones.

RealNetworks

RealNetworks is a technology company that has developed facial recognition software designed for integration with autonomous drones. This technology, named Secure Accurate Facial Recognition (SAFR), is designed to enable real-time identification of individuals from aerial footage. It has been contracted by the U.S. Department of Defense.

SAFR is marketed globally and the company has international offices in Austria, Japan, Croatia, South Korea, United Arab Emirates, India, Indonesia, Australia, Portugal and Brazil.

Reliance Jio

Reliance Jio is an Indian telecommunications and digital services company, and a subsidiary of Reliance Industries Limited. JioThings Limited, a subsidiary of Jio Platforms, has partnered with

Indian Railways to deploy AI-powered cameras at Pune station. These cameras are capable of recognizing "blacklisted" individuals and analyzing visitor data.

Israeli company Septier has provided interception and surveillance technologies to Reliance Jio. These systems enable the extraction of voice, messaging, web browsing, and email data, with the ability to also leverage AI for data analysis.

Reliance Jio has also partnered with Guavus, a subsidiary of the French defense company Thales, to employ artificial intelligence for analyzing the vast amounts of data generated daily by its user base.

RemoteDesk

RemoteDesk is an AI-powered remote workforce surveillance platform that combines facial recognition with continuous activity monitoring. The system uses AI-driven face scans to verify worker presence and identity, while also tracking keystrokes, messages, and behavioral patterns. It captures automated screenshots and webcam recordings, preserving them as “evidence” for each employee. In practice, RemoteDesk constantly monitors the screen and camera, scanning and recording for "suspicious" activity, tracking nearly everything a worker types, says, does, or looks at.

Resonant

Resonant Ltd. is a technology provider in China whose tools have been used for surveillance purposes, particularly in regions like East Turkistan (renamed Xinjiang by China.) The company supplies forensic tools capable of extracting extensive data from smartphones, including passwords, call histories, messages, multimedia files, and app data. These tools are used by Chinese authorities to monitor individuals' digital activities, including accessing data from international platforms like WhatsApp, Facebook, and Twitter.

Resonant Ltd. was formerly known as Ryan Technologies, a US-based company specializing in distributing forensic, security, and law enforcement products in China. It rebranded as Resonant Ltd. and operates through subsidiaries like Beijing Ryan Wende Science and Technology and Beijing Ryan Huade Science and Technology in China.

It has partnered with numerous US-based and international companies, including Thermo Fisher Scientific, Logicube, and REI (Research Electronics International), to distribute their products in Chin

Reveal Media

Reveal Media is a UK-based surveillance technology company specializing in body-worn cameras, including models equipped with live facial recognition capabilities. Their devices are used by several UK police forces, including British Transport Police, South Wales Police, and Leicestershire Police, offering real-time biometric identification.

The K-Series cameras utilize features like "Face Match," which allows the device to compare faces captured during patrols against a pre-configured watchlist. If a match is found, the system can trigger alerts or initiate specific actions, such as recording or streaming. Reveal Media’s DEMS 360 evidence management software includes a "Face Search" function. This tool enables users to search for matching faces within uploaded images and videos.

Revector

Revector is a UK-based company that develops mobile surveillance products, including IMSI catcher technology. Revector's Detector IMSI Catcher UAV 3.0 is a compact payload for UAVs that enables the detection, tracking, and control of 2G, 3G, and 4G mobile phones. Their IMSI catcher technology also comes in covert, portable, and vehicle-mounted configurations. In addition to IMSI catchers, Revector develops Wi-Fi catchers that identify devices by detecting their interactions with Wi-Fi networks.

According to the company's official website, Revector's surveillance technologies have been deployed in over 100 countries worldwide since 2002.

Roboteam

Roboteam is an Israeli company specializing in the development and manufacturing of tactical ground robotic systems, primarily used for surveillance in urban environments. These systems are designed for a variety of applications, including military and law enforcement. Its products, such as Probot and MTGR (Micro Tactical Ground Robot), are equipped with high-resolution cameras, thermal imaging and other sensors to perform surveillance and provide the data to its operators, who can make real-time decisions based on the intelligence gathered. Elbit Systems is one of its shareholders. In June, 2024, Roboteam entered an agreement with Psagot, a prominent investment management firm based in Israel, to buy all of the company's shares.

Rohde & Schwarz

Rohde & Schwarz is a prominent German electronics company established in 1933. In 1996, the company introduced its first International Mobile Subscriber Identity (IMSI) catcher, a device used to intercept mobile phone communications by mimicking a legitimate cell tower to capture IMSI numbers and other data from nearby devices. Since then, it has continued to develop advanced surveillance tools, including systems capable of intercepting calls, identifying devices through their International Mobile Equipment Identity (IMEI), and supporting government and defense agencies with SIGINT (Signals Intelligence) and electronic warfare products.

Root Networks

Root Networks (RN) is an Israeli company that developed systems capable of infiltrating local area networks (LANs) and intercepting communications without requiring cooperation from telecom operators. This capability enables intelligence services to conduct long-term surveillance and execute Man-in-the-Middle attacks to access encrypted communications. Captured data is redirected via VPN tunnels for detailed analysis.

RN's technology exploits vulnerabilities in router firmware to gain remote access. By mapping and infiltrating vulnerable routers, the company establishes its own interception network, independent of traditional operators. This network allows RN to monitor target devices, such as smartphones and computers, and deploy spyware for further surveillance.

Root Networks was founded by Avi Yarim, a former Rayzone Group specialist, and was led by CTO Shahar Mor, an ex-cybersecurity researcher at Verint. The company shares investors with Rayzone Group, including prominent figures like Yohai Ben-Zakai, a former deputy commander of Unit 8200, and businessman Eran Reshef.

Rostelecom

Rostelecom is one of the largest providers of Russia's telecommunications infrastructure. It offers services such as broadband internet, mobile telephony, IPTV, and cybersecurity solutions. As a state-owned enterprise, Rostelecom primarily services government sectors. Apart from cloud-based video surveillance systems, the company also deploys Deep Packet Inspection (DPI) technology.

Rostelecom is a SORM (System for Operative Investigative Activities) provider, facilitating state

surveillance by enabling Russian authorities to monitor communications.

SafeGraph

SafeGraph is a data broker known for collecting and selling aggregated location data derived from mobile apps. The company has faced significant criticism for selling data related to visits to sensitive locations, such as abortion clinics, including Planned Parenthood facilities. This data, marketed under its "Patterns" product, tracks where visitors come from, how long they stay, and where they go afterward.

In addition to its commercial ventures, SafeGraph has expanded its operations into government and military contracts. Notably, it secured a contract with the U.S. Air Force to provide data for purposes such as analyzing human activity for military operations. The company also markets its data for monitoring "adversaries" and supporting intelligence initiatives.

SafeGraph’s investors include In-Q-Tel, the VC arm of the CIA, Peter Thiel and the former head of Saudi intelligence.

Sandvine Inc

Sandvine was originally founded in 2001 as Procera Networks, a company that developed deep packet inspection (DPI) technology for network. Procera Networks was a U.S.-based company that developed deep packet inspection (DPI) technology, which can be used for internet traffic management, censorship, and surveillance purposes. Procera's technology was also allegedly used for surveillance and censorship purposes in countries with authoritarian regimes, including Bahrain, Kuwait, Turkey, Syria and Egypt. Sandvine was acquired by Francisco Partners' affiliate and merged with Procera Networks. In February, 2024, the U.S. Commerce Department (DOC) added Sandvine to its Entity List, restricting its access to U.S. technology, specifically because it provided Egypt with surveillance technology used to target activists and dissidents. The DOC removed Sandvine from the Entity List in October, 2024, after the company promised to "undergo transformative changes."

The company has since rebranded to AppLogic Networks.

Scylla

Scylla is an AI-powered surveillance system that claims to be capable of detecting and classifying human features and behaviors in real time. It has been tested by the U.S. Department of Defense at military installations.

Scylla's surveillance products are used by a variety of industries beyond the military. These include private security companies, corporate facilities, retail businesses, educational institutions, and public venues like stadiums and airports.

SearchInform

As a SORM provider, SearchInform enables the Russian authorities to monitor, intercept, and analyze communications data including phone conversations, emails, and text messages transmitted across Russian networks. The company possesses special authorization to sell and implement SORM surveillance technology under license from the Federal Security Service (FSB) of Russia.

In 2019, the company announced the development of ProfileCenter, a psychological surveillance software that monitors and analyzes all employee communications in real-time. The system builds psychological profiles of employees based on their communications, assessing motivation levels, ideological beliefs, and loyalty metrics. The technology can detect criticism of a company, and monitors emails, social media platforms, and messaging services.

Founded in 1995 as SoftInform, it rebranded to SearchInform in 2009 and is headquartered in Moscow.

Semptian

Semptian, a Chinese company, manufactures surveillance tools used by authoritarian governments across the Middle East and North Africa. These tools, including the Aegis system, Owlet, Falcon, and HawkEye, enable extensive monitoring of citizens' digital activities and communications. Its technologies are also capable of intercepting emails, such as Gmail (through a tool called Gmail Retriever), and analyzing vast amounts of data for surveillance purposes. They also develop GSM geo-location tools and the POMS (Public Opinion Monitoring System) platform for social media monitoring.

Semptian collaborates with American companies like IBM and Xilinx to enhance its surveillance capabilities, despite concerns over human rights abuses in the regions where its technology is deployed. The company’s devices intercept phone calls, texts, and internet usage.

Headquartered in Shenzhen, the company is led by its founder Chen Longsen, also known as George Chen, who previously served as the director of the local branch of the American cryptography and computer security company SafeNet.

SenseNets

SenseNets, a Chinese company that provides facial recognition software and video-based crowd analysis, is heavily involved in surveillance activities, particularly in East Turkistan (renamed Xinjiang by China.) The company operates a massive database that has been used to monitor the Uyghur population.

In 2019, Victor Gevers, a Dutch security researcher, discovered that SenseNets had left a database exposed online without authentication. This database contained sensitive personal information on over 2.5 million individuals, including names, ID card details, home addresses, photos, and GPS tracking data. The system actively recorded millions of GPS coordinates daily, tracking individuals' movements across locations such as mosques, hotels, police stations, and restaurants. The database also included information on public camera locations, suggesting integration with government surveillance infrastructure.

SenseNets is part of China’s Skynet Project, a national mass surveillance system. The company also has connections to prominent AI researchers and institutions, such as the Chinese University of Hong Kong, as well as other major Chinese surveillance firms like SenseTime and Hikvision.

The tag is: *misp-galaxy:surveillance-vendor="SenseNets"*

Senstar Technologies Corp

Formerly known as formerly known as Magal Security Systems Ltd, Senstar Technologies incorporates analytics software and fiber optic sensing into a suite of surveillance solutions, enabling functionalities like facial recognition, license plate recognition, object tracking, and behavior analysis. They have reportedly sold surveillance equipment to over 100 countries

worldwide. In 2021, the company completed the sale of their Integration Solution Division to Aeronautics Ltd., a subsidiary of Israeli defense technology company Rafael Advanced Defense Systems Ltd. As part of the acquisition, Aeronautics acquired Senstar's facility in Yehud, Israel. They have development and manufacturing facilities located in Canada, and sales and support offices in the US, EMEA, China, and APAC regions.

Sentrillion

Sentrillion is a U.S. systems integrator that develops, installs, and maintains integrated surveillance technologies primarily for border control. Its portfolio includes video and audio surveillance, intrusion-detection sensors, facial recognition software and perimeter barriers such as gates and bollards. The company has been a technology partner to U.S. Customs and Border Protection (CBP) for more than 15 years, supplying and servicing surveillance networks along land borders, seaports, and airports.

In 2024, CBP has awarded Sentrillion nine contracts totaling $36.7m to expand camera-based monitoring and biometric verification systems.

Sergek

Sergek is a surveillance and smart city platform developed in Kazakhstan. It integrates a network of cameras and sensors with data analysis tools to monitor people, traffic and assist law enforcement. The system is capable of facial recognition, tracking vehicles, and analyzing human mobility patterns in real time. Its adoption has drawn international attention, with countries like Indonesia exploring its capabilities for potential implementation for surveillance purposes.

The management of Sergek's surveillance network in Astana has been handed over to a UAE-based company, Presight, which supports the UAE's controversial mass surveillance activities.

ShadowDragon

ShadowDragon is a company that develops surveillance software that can identify aliases and collect personal data from various online sources in minutes. It is known to be used by the Polk County Sheriff's Department in Des Moines, Iowa as well as Michigan police departments, the Massachusetts State Police and other police departments throughout the U.S. It is also a contractor for the US government, including for the Immigration and Customs Enforcement (ICE.)

Its SocialNet tool enables government agencies to access and analyze publicly available data from over 200 websites, apps, and social networks. These include major platforms like Meta (Facebook, Instagram, Threads), TikTok, Telegram, Bluesky, Discord, and niche sites such as BeReal, FetLife, and Chess.com. SocialNet allows clients to input various identifiers (e.g., email, alias, or phone number) to uncover connections, map activities, and track individuals' digital footprints. The tool is marketed as capable of identifying relationships, interests, and physical locations. Its other products include OIMonitor, MalNet, Spotter, and Horizon.

Shield AI

Shield AI develops AI-powered drones for intelligence gathering and surveillance in military operations. Its products include battlefield drone swarms, unmanned aircraft like the V-BAT, and advanced AI systems such as Hivemind, which enable autonomous mission execution across air, land, and sea with intelligence, surveillance, and reconnaissance (ISR) capabilities. In July 2024, Shield AI's V-BAT secured a $198 million contract with the U.S. Coast Guard. It has also partnered with companies like Haivision and Sentient Vision Systems to enhance full-motion video AI object detection and wide-area surveillance with ViDAR technology.

Israel uses its self-piloting drones in Gaza.

Shoghi Communications

Shoghi, an Indian cyberintelligence firm founded by Harish Gupta, rose to prominence in the late 2000s under the leadership of Anant Bindal, a businessman from a powerful family in India. The company secured a large $200 million contract to supply India's external intelligence agency, the Research and Analysis Wing (R&AW), with advanced interception technologies, including IMSI-catchers and COMINT tools.

The company became internationally recognized when it was named in WikiLeaks' "Spy Files" as part of a global surveillance industry catering to governments and intelligence agencies.

Bindal later relocated to the UAE, where he founded Stratign, a Dubai-based firm that mirrors

Shoghi's model of distributing and integrating interception solutions sourced from other companies.

Skydio

Skydio, founded in 2014, is a U.S. drone manufacturer and developer of autonomous flight technology. The company develops and distributes in AI-powered drones equipped with autonomous capabilities and computer vision systems. Since launching their R1 drone in 2018, Skydio has served over 1,200 enterprise customers including every branch of the U.S. military.

Skydio became the first U.S. drone company to reach a $1 billion valuation, generating over $100 million in annual revenue in 2023, with 30% coming from software solutions. The company has a local office in Israel and sells its drones to the Israeli military. The Israeli company DefenSync is its authorized partner in Israel.

Based on a report by Theia Chatelle, the Yale Police Department (YPD) utilized Skydio drones as part of their surveillance program targeting pro-Palestine student protesters.

According to a Wired investigation, a Skydio X10 drone equipped with multiple high-resolution cameras, thermal imaging, powerful zoom capabilities, and onboard AI was detected monitoring pro-Palestine protesters at the Democratic National Convention in Chicago, with the same drone later being spotted above the Israeli consulate during subsequent protests.

In October 2025, The Washington Post revealed that Skydio provided the U.S. Immigration and Customs Enforcement (ICE) remote-controlled drones, reportedly used to film protesters and monitor public demonstrations.

The tag is: *misp-galaxy:surveillance-vendor="Skydio"*

Skypearl

Skypearl Ltd, a discreet Israeli start-up co-founded by Sergey Vichik, a former Google X engineer, and Ori Gonen, a former Israeli military officer, is a developer of stratospheric Intelligence and surveillance platforms. Their products include spy balloons for intelligence operations.

These semi-autonomous balloons, part of the classified Tzafon Aerostat programme, were deployed since 2023 over Gaza. Equipped with technologies such as gyroscopic stabilization, AI-driven altitude control, SIGINT sensors, Lidar, and multispectral imaging systems, the balloons silently monitor and surveil populations in real time.

Skypearl has minimal public presence, with its headquarters registered in Herzliya and no official website or trade show appearances.

Smart Communications

Smart Communications, a Florida-based company, provides surveillance and communication tools

to over 150 prisons and jails across more than 25 U.S. states. Its MailGuard product digitizes postal mail sent to incarcerated individuals by scanning letters at remote facilities and uploading them as PDFs for inmates to view on tablets.

The company also offers a surveillance system called Smart Tracker, which monitors not only the communications of incarcerated individuals but also those of the public who correspond with them. This system collects a wide range of data, including home addresses, IP addresses, email addresses, GPS locations, device information, and any linked accounts. By requiring users to create accounts through its "Smart Jail Mail" portal, the company ties this data to specific individuals, creating a detailed profile of those who communicate with prisoners. They also provide a searchable database of all messages sent and received by prisoners, along with identifying information about senders.

The tag is: *misp-galaxy:surveillance-vendor="Smart Communications"*

Snaptrends

Snaptrends was a social media monitoring and surveillance platform that developed ways to analyze geotagged social media posts and conversations in real time. The platform was marketed to law enforcement agencies, schools, and other organizations, enabling users to track keywords, hashtags, and geographic areas of interest.

Law enforcement agencies across the United States utilized Snaptrends to track targets and monitor public events. For example, the software was reportedly used to increase arrest rates during specific operations. Snaptrends was also used to monitor students' social media activity, often in collaboration with schools.

The company promoted social media analytics tools to authorities in Azerbaijan, Bahrain, Malaysia, Turkey, and other countries known to suppress online speech, according to confidential company documents and interviews with current and former employees. Beginning in 2013, Snaptrends pursued business in Saudi Arabia, entering a $500,000 agreement with a company linked to the royal family to sell its technology. The company also engaged with the Saudi Ministry of Interior and intelligence agencies. It has also done business with the United Arab Emirates.

In 2014, Brandon Burris, Snaptrends co-founder and chief technology officer at the time, flew to Hong Kong as part of a $300,000 deal with a local holding company Faith Concord. According to corporate filings in China, Faith Concord owns BaoLiDa, which markets its ability to monitor citizens' activities on the internet to the Chinese government.

Snaptrends faced criticism for targeting activists or disproportionately affecting marginalized communities. These concerns led platforms like Twitter to sever ties with Snaptrends, cutting off access to their data in 2016. Snaptrends ceased operations later that year, laying off its staff and shutting down quietly.

The tag is: *misp-galaxy:surveillance-vendor="Snaptrends"*

Social Sentinel

Social Sentinel, now known as Navigate360, is a technology monitoring company that tracks students' social media behavior, claiming to identify risks of self-harm or violence on campuses and alert administrators. Reports indicate that the service has been used to monitor student protests and scrutinize individuals who have lodged complaints against university administrations.

According to the Dallas Morning News, campus police used it to surveil student protests. Their investigation also uncovered that the company promoted its services to various universities as a way to manage and prevent protests. The documents suggest the company is expanding its scope, offering tools for monitoring student emails on university platforms.

SOSi

SOS International LLC (SOSi) is a company that helps government agencies track down people. In October 2025, ICE contracted SOSi for $7 million to perform "skip tracing services", essentially locating individuals who are difficult to find. The company employs image recognition technology that can match faces and license plates to databases, which includes facial recognition capabilities.

SOSi operates internationally. The company is headquartered in Reston, Virginia, but maintains offices and customer engagements in at least 40 countries worldwide.

The tag is: *misp-galaxy:surveillance-vendor="SOSi"*

SoundThinking

SoundThinking was formerly known as ShotSpotter, Inc until it changed its corporate name in 2023. ShotSpotter, which retained its name as a product after the rebrand, relies on a network of

acoustic sensors that monitor urban environments, effectively turning public spaces into zones of constant surveillance. The accuracy of ShotSpotter has been called into question, with reports indicating that the system can misidentify sounds, leading to unnecessary and dangerous police deployments as well as over-policing in various communities. ShotSpotter is linked to more than 100 law enforcement agencies in the U.S.

Another one of their products, CrimeTracer, functions as a police database and search engine, repackaging and sharing vast amounts of data across a range of law enforcement agencies. The company further consolidated its position in the surveillance industry after acquiring Geolitica, the firm behind PredPol, a predictive policing technology criticized for exacerbating racial inequalities by directing police to already heavily surveilled communities. This merger builds on SoundThinking's previous acquisition of HunchLab in 2018 to provide AI-driven analysis and "predictive policing."

In addition to police departments, SoundThinking also has contracts with the U.S. Department of Defense in the military market and also maintains a partnership with Israeli weapons manufacturer Airobotics.

The tag is: *misp-galaxy:surveillance-vendor="SoundThinking"*

SpeechPro

SpeechPro, a Russian company specializing in speech recognition, facial recognition and voice biometrics, has its origins linked to a secretive Soviet technologies unit that operated under the KGB. According to Wired, the company's roots can be traced back to the Sharashka Marfino, a special prison for engineers and scientists during the Stalin era. In this facility, individuals plucked from various labor camps were coerced into developing technologies, including voice identification systems used for monitoring calls to foreign embassies in Moscow. According to its website, it worked with Saudi's Ministry of Interior to install an audio forensic lab in the Kingdom. The country operates in Russia under the name Speech Technology Center (STC.) In 2019, Sberbank, the

state-controlled financial powerhouse, finalized the acquisition of a 51% stake in STC. Additionally, Digital Horizon, a venture capital and business incubator firm with offices in Moscow and Tel Aviv, also secured a stake in STC.

Spire Solutions

Spire Solutions is a distributor of Israeli surveillance and interception technologies in the United Arab Emirates. It's one of the primary distributors for XM Cyber, led by former Mossad chief Tamir Pardo and whose partnerships include Rafael Advanced Defense Systems, an Israeli defense technology company behind sophisticated surveillance systems. The company also distributes technology from the Israeli firms Check Point Software Technologies Ltd and CyberArk Software Inc. Spire Solutions actively markets defense and intelligence tools from Germany's Rola Security Solutions.

In addition, Spire has been working with Russian-Singaporean firm Group-IB, Britain's Digital Shadows and US company ThreatConnect.

Staqu

Staqu Technologies, an Indian AI startup, provides facial recognition technology to various government agencies in India. Its tools are used by law enforcement in multiple states, including Uttar Pradesh. The company has developed Crime GPT, an advanced AI-powered platform designed to assist law enforcement agencies. Crime GPT integrates generative AI capabilities with tools like facial recognition, voice-based search, and biometric analysis. It can process and analyze digitized records, including data from CCTV feeds, images, and audio inputs.

Trinetra 2.0, launched in collaboration with the Uttar Pradesh Police, incorporates Crime GPT to enhance policing capabilities, to provide real-time AI-assisted insights for intelligence operations. Staqu's technology is also deployed in prisons.

Additionally, Staqu has implemented other AI-driven surveillance products, such as its JARVIS platform, which is being used by the Gurugram Police for vehicle number plate recognition. This system utilizes existing CCTV cameras to automatically scan and verify number plates against official RTO data.

Stellar Technologies

Stellar Technologies is a developer of surveillance and artificial intelligence tools. One of its primary products is NesherAI, a facial recognition tool capable of identifying individuals even when they are wearing masks. This tool has been utilized by private groups and organizations to identify participants in protests, specifically pro-Palestine activists, students, and faculty. It has been employed to assist in reporting foreign students and activists to U.S agencies such as ICE, leading to visa revocations and deportations.

The company's other tools include CyberBird, claiming to offer "revolutionary surveillance."

Stratign

Stratign offers IMSI Catcher systems designed to collect basic identities (IMSI, IMEI) of 2G, 3G, and 4G mobile phones within their coverage area. The company's IMSI Catcher systems are available in various configurations, including standalone, backpack, vehicle-mounted, and drone-mounted versions. Their features include real-time monitoring, target location tracking, and the ability to manage cellular communications effectively. The company also offers facial recognition systems.

Stratign primarily acts as a distributor, rebranding technologies from other companies and sometimes incorporating them into deals without the manufacturers' knowledge. The company is reportedly owned by Indian businessman Anant Bindal.

Support King

Support King, founded by Scott Zuckerman and headquartered in Puerto Rico, built a small but notorious catalog of stalkerware apps that secretly harvested victims' photos, messages and location data. These products include SpyFone, the Android/iOS spy tool marketed directly by Support King until a 2021 FTC order forced it offline after a massive data breach, OneClickMonitor, and SpyTrac, a phone-monitoring app that surfaced in 2022.

SpyTrac's leaked server data tied its freelance developers and infrastructure back to Support King, suggesting the company was trying to evade the FTC ban. The 2021 FTC decision permanently barred Support King and Zuckerman from "offering, selling or promoting" any surveillance software because they repeatedly failed to secure user data. Zuckerman is now petitioning the agency to lift that ban so he can re-enter the surveillance market.

Synesis

Synesis, a Belarusian technology firm, has gained notoriety for its role in the development and deployment of facial recognition systems used by Russian authorities to monitor and suppress

dissent. Its flagship product, the Kipod platform, has been instrumental in tracking political activists and protesters, particularly in the wake of Russia's invasion of Ukraine. The system has been integrated into Moscow's extensive surveillance network, which utilizes advanced algorithms to identify individuals in real-time, often leading to preemptive detentions of those critical of the government.

Despite sanctions by the U.S, EU and the UK, reports indicate that Synesis continues to operate with support from technology belonging to major U.S firms, like Nvidia and Intel, which power the performance and efficiency of its algorithms. Synesis has been able to access U.S. technology through various channels, including third-party distributors. These components enable Synesis to process large volumes of data quickly and accurately, facilitating real-time facial recognition and identification.

SyTech

SyTech (Сайтек) is a Russian private IT contractor known for working with Russian intelligence and military agencies, including the FSB (Federal Security Service). The company gained international attention in 2019 when it was hacked by a group called 0v1ru$, which exposed internal documents detailing its involvement in secretive surveillance projects. Some of the leaked projects include Nautilus-S, aimed at de-anonymizing users of the Tor network by collecting and analyzing their data, Mentor, designed for monitoring and analyzing social media platforms, and Hope, a project dedicated to isolating the Russian internet (Runet) from the global internet.

SZ DJI

SZ DJI Technology Co., Ltd. (SZ DJI) has provided drones to the Xinjiang Public Security Bureau, which are used to surveil and target Uyghurs, Kazakh, and Kyrgyz people. The company is a major supplier of camera drones and other products to 43 countries globally, including the US, UK, and Australia. It also sold drones to the Serbian government. Key investors include Accel and Sequoia Capital.

TAG International

TAG International is a security and intelligence consultancy formed in 2021 through the merger of Axiom International and Torchlight Group. The company is one of the main recipients of funding from the UK's Conflict, Stability and Security Fund (UKSIF). TAG International has extensive involvement in surveillance activities, deploying advanced technologies and expertise to assist governments and organizations in data and intelligence gathering and analysis.

Intelligence Online revealed that TAG International is operating a major training contract with the Saudi security forces under a secretive British government program.

Tamoco

Tamoco is a data tracking startup leveraging a network of 1.1 billion proximity sensors to track the locations of approximately 100 million smartphone users. By partnering with apps that struggle to monetize, such as mobile games, offline maps, and deals apps, Tamoco integrates its tracking capabilities into these platforms. When users install these apps and accept the terms, their location data becomes part of Tamoco's network. Tamoco utilizes a combination of Wi-Fi signals, Bluetooth beacons, GPS, QR codes, and metadata (like device type, battery level, and dwell time) to track users. This data is then sold to third parties.

In 2023, Tamoco underwent an asset acquisition by PassBy, a company that also develops location-based technology.

TechOps Specialty Vehicles

TechOps Specialty Vehicles (TOSV) is a company that builds custom vehicles for law enforcement, outfitting them with various surveillance technologies. It supplied U.S. Immigration and Customs Enforcement (ICE) with vehicles equipped with cell-site simulators, commonly known as fake cell towers or "stingrays." This enables law enforcement agencies to intercept cellular signals and track mobile phones by mimicking legitimate cell towers, forcing nearby devices to connect to them.

The company is headquartered in Stevensville, Maryland. The company also maintains sales locations in Denver, Colorado, and Whitefish, Montana.

Terrogence

Terrogence, now known as SenseCy, is an Israeli surveillance company founded by former intelligence officers. It built a massive facial recognition database called Face-Int. This database is populated with facial images of thousands of individuals, collected from platforms like Facebook, YouTube, and other online sources. The company’s founders, including Shai Arbel, leveraged their expertise to create tools that gather intelligence through "virtual entities" - fake online profiles designed to infiltrate social media platforms and collect data and intelligence from users.

Terrogence provides intelligence services to entities such as the U.S. government, including the NSA and Navy.

The company was acquired by the Israeli surveillance giant Verint in 2017, and is now part of a suite offered by Cognyte, which was spun off of Verint in 2021.

The tag is: *misp-galaxy:surveillance-vendor="Terrogence"*

The Gospel

The Gospel is an AI target-creation platform which provides assasination targets in Palestine. The system has significantly accelerated the process of identifying and recommending targets, allowing Israel to strike many more locations. There are also concerns about the accuracy of the system and its heavy impact on civilians. The Gospel is powered by intel such as intercepted communications, surveillance data and information drawn from monitoring the movements and behaviour patterns of individuals and large groups in Palestine.

The tag is: *misp-galaxy:surveillance-vendor="The Gospel"*

TigerSwan

TigerSwan is a global firm founded in 2008 by James Reese, a retired U.S. Army lieutenant colonel and former Delta Force commander. The company led the surveillance operations and infiltration of the Dakota Access Pipeline (DAPL) protests at Standing Rock. Hired by Energy Transfer, the company behind the pipeline, TigerSwan used a range of methods to monitor and disrupt the Indigenous-led resistance movement. These tactics included the use of undercover operatives, aerial surveillance, social media monitoring, and the creation of detailed dossiers on activists. The firm also collaborated with law enforcement, sharing intelligence and supporting legal actions against protestors.

Following its involvement at Standing Rock, TigerSwan sought to profit from its surveillance tactics by marketing its "counterinsurgency" playbook to other energy companies. The firm created detailed marketing materials and presentations, pitching its strategies to corporations like ConocoPhillips and Dominion Energy, which were involved in other contentious oil and gas projects.

Travizory

Travizory is a Swiss company that develops advanced border and surveillance technology. Its primary product, the API-PNR Targeting System, utilizes real-time traveler data, including Advance Passenger Information (API) and Passenger Name Records (PNR), to assess "risks" and identify individuals of interest before they cross borders. The system integrates AI-powered profiling and automated alerts for use by border officials, connecting governments with transport operators, and uses its AI for decision-making on which passengers to prevent from entering a country.

According to a report by Wired, Travizory uses its algorithms to analyze up to 150 variables, including travel patterns, connections to known persons of interest, and anomalies in behavior. For example, the system can flag travelers whose behavior deviates from typical patterns, such as short visits with excessive luggage or unusual spending habits. These assessments are used to generate risk classifications, which are shared with government agencies, including customs, immigration, and intelligence services. Currently operational in Kenya and the Seychelles, Travizory is also in discussions to expand its system to 20 other African countries.

The tag is: *misp-galaxy:surveillance-vendor="Travizory"*

Trenchant

Trenchant, also known as L3 Trenchant, is a surveillance provider owned by defense contractor L3Harris Technologies that develops government hacking tools and zero-day exploits for Western governments. The entity was formed from the merger of two sister startups, Azimuth and Linchpin Labs, both of which were acquired by L3Harris. Trenchant operates with strictly compartmentalized teams that develop platform-specific tools, including iOS zero-days and spyware.

The tag is: *misp-galaxy:surveillance-vendor="Trenchant"*

TRL Technology

TRL Technology Limited was a UK-based company that sells surveillance technology, including a product called Marlin, which can intercept calls made on satellite phone networks. The company was acquired by L-3 Communications, which later changed its name to L3 Technologies and eventually merged with Harris Corporation to form L3Harris Technologies.

The tag is: *misp-galaxy:surveillance-vendor="TRL Technology "*

TruePosition

TruePosition markets its "location intelligence" (LOCINT) technology to intelligence and law enforcement agencies worldwide. Over the past four years, the company has expanded its tracking technology globally. In the U.S., TruePosition sells its products to mobile carriers, although it remains vague about any usage by the U.S. government. Internationally, it supplies governments, without disclosing specific clients. Since the introduction of LOCINT in 2008, there has been significant interest from defense and interior ministries globally. In 2016, TruePosition released its TrueFix Location System. The system offers M2M/IoT capabilities, improving its location tracking services.

Tykelab

Tykelab, a little-known company based in Rome, has been utilizing dozens of phone networks, often located on remote Pacific islands, to send tens of thousands of secret “tracking packets” worldwide. These packets target individuals in countries such as Libya, Nicaragua, Malaysia, Costa Rica, Iraq, Mali, Greece, and Portugal, as well as within Italy itself. Tykelab exploits longstanding but often unaddressed vulnerabilities in global phone networks, allowing third parties to track phone users’ locations and potentially intercept their calls without leaving any trace on the devices. Tykelab’s parent company, RCS Lab, has also developed a powerful phone hacking tool called Hermit. Once installed on a victim’s device, Hermit can remotely activate the phone’s microphone, record calls, access messages, call logs, contacts, photos, and other sensitive data.

Uniview Technologies

Uniview, also known as Zhejiang Uniview Technologies, or by its abbreviation UNV, develops and deploys video surveillance systems, including "infrared antiriot" cameras and software that enable real-time image sharing by police agencies across jurisdictions. Uniview's systems are used to suppress political and religious dissent, particularly in regions like Tibet. In 2017, Uniview was revealed to be a reseller and alliance partner of Quantum Corporation, a U.S data storage and management company.

According to the Asian Venture Capital Journal, Uniview was a corporate carve-out of Hewlett-Packard's China-based surveillance business. It was purchased by Bain Capital, and then sold to China Transinfo Technology Co. Ltd.

Veraset

Veraset is a provider of location and mobility data, offering datasets derived from GPS signals. According to the Washington Post, Veraset shared billions of phone location records with the D.C. government as part of a COVID-19 tracking effort. This data, which was provided without people's consent, was used to monitor movement patterns during the pandemic. However, officials will not disclose the specific reasons for acquiring the data or how it was used.

Veraset was originally founded as a subsidiary of SafeGraph, but the two companies now operate independently.

Veriato

Veriato is a developer of AI-powered User Activity Monitoring (UAM) products. A key capability of their surveillance technology is its ability to capture communications activity across multiple platforms, extending beyond traditional email clients to monitor popular external messaging and chat applications. It also tracks comprehensive file activities including creation, editing, deletion, and renaming across local storage, removable media, and cloud storage platforms. The collected data is processed through AI-powered predictive analytics that analyze user behavior patterns.

A key feature of Veriato's technology is its daily "risk score" system, which assigns each worker a score indicating the likelihood they pose a security threat to their employer. The risk score incorporates multiple components, including sophisticated AI analysis that examines the text content of workers' emails and chats to determine employee sentiment and detect changes that may indicate disgruntlement.

The company claims to serve thousands of customers across almost 70 countries around the globe.

Verint

U.S.-Israeli company Verint provides sophisticated eavesdropping equipment, including "monitoring centers" that allow for the interception, monitoring, and analysis of both targeted and mass communications across various networks. These systems are integrated into a country's communication infrastructure and are capable of intercepting phone calls and emails from millions

of citizens, storing the data for analysis. Verint's technology is employed in over 75 countries and can be used for nationwide mass interception, voice identification, and data mining to build detailed profiles of individuals.

Verint sold their technology to repressive regimes worldwide, including in Azerbaijan, Indonesia, South Sudan, Uzbekistan and Kazakhstan. The technology sold to Azerbaijan was reportedly used to identify the sexual orientations of individuals through social media, leading to the targeting and arrest of LGBTQ+ individuals. In Bahrain, Verint products have been used to gather data from social networks, contributing to the repression of dissidents for their online activities. Additionally, in Indonesia, Verint's technology has been employed to compile databases of LGBTQ+ rights activists and monitor religious minorities.

Verint has also been linked to surveillance operations in South Sudan, where it provided communications interception equipment and support services to the government. This arrangement required the telecommunications company Vivacell to pay Verint over $762,000 to facilitate the interception of citizens' communications, as reported by Amnesty International.

The tag is: *misp-galaxy:surveillance-vendor="Verint"*

Verita Innovation

Verita Innovation is a developer of surveillance technology, including advanced IMSI Catchers. The company claims these systems utilize software-defined radio (SDR) technology to seamlessly operate across multiple cellular networks, such as GSM, UMTS, LTE, and Wi-Fi, covering a wide

range of frequency bands. It's also designed with a modular structure, allowing it to adapt to various applications, from portable shoulder-bag setups to vehicle-mounted systems and geographically distributed fixed solutions.

Their products also include a Location System, a protocol-based solution that enables intelligence and law enforcement agencies to covertly locate, track, and manipulate subscribers in real time. This system features an interface with map support for location monitoring worldwide.

Veritone

Veritone is an enterprise AI company that provides surveillance and investigative tools to law enforcement and government agencies. Its primary product, Veritone Track, is a video forensics platform that enables users to identify and track individuals and vehicles across large amounts of video footage, including body cameras, CCTV, drones, and social media feeds.

A significant upgrade to Veritone Track was announced in October 2024, expanding its capabilities to include AI-assisted vehicle tracking at scale. This update allows investigators to trace vehicles of interest across multiple video sources. The platform's AI engine supposedly analyzes video footage to identify vehicles by their visual features. Its customers include the U.S Department of Homeland Security.

Microsoft Azure provides Veritone with cloud computing resources to support its AI-powered surveillance platforms.

Verkada

Verkada is a provider of cloud-based enterprise video surveillance systems, primarily used by police agencies. It offers features like People Analytics, enabling users to filter individuals detected on camera by clothing, appearance, and facial matches. Their cameras include fisheye models with night vision for low-light areas, bullet cameras designed as visible deterrents, and dome cameras for high-traffic locations.

In 2021, Verkada was breached, giving hackers access to over 150,000 surveillance cameras inside hospitals, organizations, police departments, prisons and schools.

Videotec

Videotec was an Italian company that specializes in the design and manufacture of professional video surveillance equipment. During a June 2018 Who Profits field tour in the old city of Jerusalem, Videotec cameras were documented as part of the surveillance system in the occupied

area. The company's official distributer in Israel is Mal-Tech Technological Solutions, a private Israeli company owned by Moshe Amzel. Mal-Tech provides solutions to the Israeli government such as cameras and network devices. It provides equipment to security bodies such as the Israeli army, the Israeli Police and the Israeli Ministry of Defense. In 2022, it was acquired by Motorola Solutions.

Vigilant Solutions

Vigilant Solutions is a Motorola subsidiary and longtime partner in U.S. Immigration and Customs Enforcement (ICE)'s vehicle tracking operations. Under a $6.1 million contract, ICE has gained access to Vigilant's extensive database of automated license plate reader (ALPR) data, which includes over 5 billion location records collected from private entities such as parking lots and insurance companies, as well as an additional 1.5 billion records from more than 80 local law enforcement agencies across at least a dozen states. Internal communications revealed by the ACLU indicate that ICE agents have obtained license plate data through informal requests to local police, circumventing official protocols. ACLU's reports also revealed that at least 9,000 ICE agents had access to the database of Vigilant Solutions.

Viisights

Viisights develops behavioral video analytics powered by artificial intelligence. One of their products, Wise, is designed to analyze real-time video feeds to detect and interpret human behaviors. Viisights has been reportedly used in monitoring refugees in Greece as part of the EU-funded Centaur surveillance system. This system, which includes tools from other Israeli companies, has been criticized for creating "prison-like" conditions for refugees. The refugee camps, such as the one on the island of Samos, have been described as "testing grounds" for surveillance technologies later deployed elsewhere in Europe.

Viisights' behavioral video analytics are also used by Israel's Ministry of Public Security and in smart city initiatives, such as in the city of Eilat, to detect and analyze events in real-time.

The company's Wise platform has been integrated with Cognyte's Symphia solutions, to improve the capabilities of both systems for behavioral video recognition. Cognyte is a prominent Israeli vendor of surveillance products.

Vintra

Vintra is a company that develops AI-powered video analytics technologies that turn raw video footage into intelligence, primarily for use by law enforcement agencies. Their platform, FulcrumAI, is designed to analyze video from a variety of sources, including fixed surveillance cameras, body-worn cameras, dashcams, and drones. The technology supports real-time monitoring and post-event investigations, offering features like facial recognition, object detection, and behavioral analysis. Its clients include the Sacramento City Police Department and the NYC Department of Investigations.

Void Balaur

Void Balaur is a notorious hacker-for-hire group, active since at least 2015, specializing in cyberespionage and data theft. Built for targeting individuals, businesses, and organizations globally, Void Balaur has been linked to phishing campaigns, credential theft, and selling stolen data, including private emails and sensitive information. Their targets often include political figures and journalists. In 2022, Google's Threat Analysis Group (TAG) took action against Void Balaur by blocking dozens of malicious domains associated with the group. These domains were used in credential theft campaigns targeting high-risk individuals and organizations.

Voyager Labs

Voyager Labs is a developer of AI-driven investigation tools designed for law enforcement, national security, and corporate security. Its platforms, such as VoyagerAnalytics and VoyagerInsights, are capable of analyzing large amounts of unstructured data from open, deep, and dark web sources, as well as internal databases. These tools help uncover social connections, analyze human behavior, and identify targets. Between 2018 and 2019, dozens of journalists were targets of Colombian military intelligence using VoyagerAnalytics.

The company was exposed for creating fake accounts to scrape data from platforms like Facebook and Instagram. This resulted in Meta filing a lawsuit against Voyager Labs for improper data collection from millions of its users.

The New York Police Department (NYPD) and the Los Angeles Police Department (LAPD) have reportedly used Voyager Labs' tools to scrape data from social media platforms as part of their surveillance efforts.

While it has relocated its headquarters to the United States, its origins and R&D center remain in Israel. It has additional offices and a registered entity in the UK.

Vumacam

Vumacam operates one of South Africa's largest urban CCTV networks, linking thousands of high-definition cameras to a cloud platform called Proof. The system uses IntelexVision's iSentry AI engine to watch every feed in real time and automatically flag incidents. Vumacam also uses License Plate Recognition (LPR) technology to identify and track vehicles.

Provincial and municipal authorities, including the Gauteng Provincial Government, tap into Vumacam's live feeds and analytics for policing purposes.

Vumacam is owned by Vumatel, one of South Africa's biggest fibre internet providers.

The tag is: *misp-galaxy:surveillance-vendor="Vumacam"*

Vupen Security

Vupen Security was a French information security company founded in 2004 and based in Montpellier with a U.S. branch based in Annapolis, Maryland. Its specialty was in discovering zero-day vulnerabilities in software from major vendors in order to sell them to law enforcement and intelligence agencies which use them to achieve cyber operations. One of the company's co-founders, Chaouki Bekrar, is also the founder of Zerodium, a cybersecurity company known for its controversial business model of purchasing zero-day vulnerabilities and exploits from security researchers and then selling them to government agencies and private entities, including law enforcement and intelligence agencies.

Watrix Technology

Watrix Technology is a Chinese AI company that develops advanced computer vision and large scale video data analysis products. Founded in 2016, Watrix has developed a proprietary gait recognition system capable of identifying individuals based on their walking patterns from distances up to 50 meters, including when their face is obscured or turned away. Chinese police forces in cities like Beijing and Shanghai have utilized Watrix's gait recognition system to monitor public spaces and identify individuals without relying on facial recognition.

In 2022, it was reported that Watrix and another Chinese surveillance firm, GEOAI, used Nvidia chips to train AI patrol drones and systems designed to identify people by their walk.

Wayout

Wayout Group is a discreet Israeli company founded in 2018 by Gil Dolev, whose sister Shiri Dolev was NSO's head of operations. The company operated as a subsidiary of the NSO Group after an acquisition in the range of $20 million, and was later sold to Goatilev, a company controlled by NorthPole, the financial vehicle of Novalpina Capital, which also oversees Q Cyber Technologies (of which NSO Group is a registered subsidiary.)

The company develops tools that compromise routers and intercepts Internet of Things (IoT) data, providing law enforcement and intelligence agencies with the ability to covertly gather information from connected devices. Its team is composed largely of former officers from Israel's Unit 8100 and Unit 8200.

Xinjiang Lianhai Chuangzhi

Xinjiang Lianhai Chuangzhi Information Technology Co., Ltd. is a wholly-owned subsidiary of the China Electronics Technology Group Corporation (CETC), a large state-owned military contractor. The company supplies the Integrated Joint Operations Platform (IJOP) system, which is a major component in the region's surveillance infrastructure. The IJOP is described in multiple reports as a "system of systems" that aggregates data from many sources: facial recognition cameras, CCTV, checkpoints, and a wide range of apps.

The company has built AI-powered checkpoint systems that can detect and track individuals, particularly Uyghurs, as they move around cities. These systems integrate facial recognition, cameras, and other biometric monitoring.

The U.S. Department of Commerce added the company to its Entity List on July 9, 2021, along with 13 other Chinese companies which were sanctioned for their involvement in human rights abuses and surveillance activities in Xinjiang.

XRVision

XRVision, a company founded by Yaacov Apelbaum and Guy Ron, is a provider of AI-driven facial recognition and video analytics tools. The company has secured contracts with government agencies including the US Customs and Border Protection in 2019 to deploy its facial recognition technology at the US border. Services for that contract include: "software for wearable devices, mobile phones, tablets, and laptops, namely, software for matching human face images; Computer application software for wearable devices, mobile phones, tablets, and laptops for video analytics, namely, software for matching human faces and performing face recognition."

XRVision is also backed by Boundary Holding, a Luxembourg-based private equity firm led by Rajat Khare, who has a history of cyber-espionage through his firm Appin Security.

Apelbaum, XRVision's co-founder, has deep ties to the surveillance and intelligence industries. He previously served as Chief Technology Officer at AGT International, a Swiss-based firm that developed the Falcon Eye surveillance system for the UAE authorities.

Xuexi Qiangguo

Xuexi Qiangguo, translated as "Study the Great Nation," is a mobile application launched by the Chinese government in early 2019. While initially promoted as an educational tool to promote Xi Jinping Thought and Party ideology, Xuexi Qiangguo has evolved into a multifaceted platform that also serves as a surveillance and monitoring tool. Beyond tracking user activities within the app, Xuexi Qiangguo also collects personal data to create detailed profiles of users for surveillance purposes. The app's gamified structure ties into China's broader social credit system, where positive engagement with Party propaganda content can contribute to a higher social credit score. Negative activities or associations can result in penalties, restrictions or imprisonment. The app was developed in collaboration with the Chinese tech giant Alibaba.

YITU

YITU is a Chinese company that specializes in surveillance technology. The company has gained recognition for its advanced capabilities in facial recognition, so much so that it won first place in a 2017 facial recognition algorithm contest held by the United States government's Office of the Director of National Intelligence. Yitu provides high-tech surveillance in the UAE, where it maintains an office in Abu Dhabi. Yitu Limited owns or controls, directly or indirectly, Shanghai Yitu Technology Co., Ltd. (Yitu), an entity that operates or has operated in the surveillance technology sector of the economy of the PRC. Yitu has been involved in developing facial recognition technology that looks exclusively for Uyghurs and has been integrated into China's rapidly expanding networks of surveillance cameras. In addition, Yitu has established an overseas office to export its surveillance technology to foreign law enforcement agencies. Yitu has gained wide recognition for its Dragonfly Eye System, a facial scanning platform that can identify a person

from a database of at least 2 billion people in a matter of seconds.

The tag is: *misp-galaxy:surveillance-vendor="YITU"*

Yozmot

Founded by former Israeli army colonel Dany Tirza, Yozmot Ltd. develops body cameras equipped with facial recognition technology for Israeli forces. The company is headquartered in Kfar Adumim, a Jewish settlement in the occupied West Bank. The company claims its facial recognition software can scan crowds and detect individuals in realtime, even if their faces are obscured.

Yozmot's AI-powered biometric matching capabilities is powered by Corsight.

The tag is: *misp-galaxy:surveillance-vendor="Yozmot"*

Zencity

Zencity is an Israeli data analytics company that helps local governments monitor public sentiment by analyzing social media, message boards, local news, and other public data sources. Serving over 200 agencies across the United States, its platform is used by U.S cities like Phoenix, New Orleans, and Pittsburgh to track public reactions to topics. It also enables police agencies to track negative sentiment toward law enforcement without residents' knowledge or consent.

The lack of public oversight in contracts with Zencity, often approved without city council input, has led to criticism that usage of the tool prioritizes surveillance over genuine community engagement.

The tag is: *misp-galaxy:surveillance-vendor="Zencity"*

Zenith Technologies

Zenith Technologies is a developer of AI-powered surveillance products. The company showcased its AI EagleEye Intelligent Patrol, integrated with Saudi Arabia's first Lucid police patrol vehicle, at the World Defense Show in Riyadh in 2024. This platform features six embedded AI cameras, providing 360-degree situational awareness, real-time streaming, Automatic Number Plate Recognition (ANPR), facial recognition, and other AI-powered data analytics designed for law enforcement. It also develops an AI-enabled drone, which extends surveillance capabilities from the patrol vehicle, and streams live footage and other data to a central command operated by police agencies.

The company deploys its tools to various agencies in the Gulf region, including Dubai Police and Ajman Police in the UAE, where it also has a regional office.

Zero Security

Zero Security Research Labs is a zero-day vulnerability reseller that also offers intelligence-gathering systems, including IMSI-catchers and Wi-Fi interception tools. One of their primary products, Xperia-Active, enables the capture of IMSI, IMEI, and TMSI data, as well as real-time communication interception. The company is founded by Andres Acosta, Azizjon Mamashoev, and James Grandoff, and is headquartered in Florida, USA.

ZeroEyes

ZeroEyes is a AI-powered gun detection technology founded in 2018 by a team of Navy SEALs. The system integrates with existing security cameras to monitor video feeds 24/7, scanning for visible firearms. If a firearm is detected, the system sends human-verified alerts within 3-5 seconds to school administrators and law enforcement. The technology has been widely adopted in schools across nearly 40 U.S. states.

ZeroEyes was involved in a false alarm incident at a Texas high school, where its AI system incorrectly identified a threat and triggered a lockdown.

Zhongke Ronghui Security

Zhongke Ronghui Security Technology is a Chinese company that develops surveillance and forensic data extraction tools, including the XDH-5200A scanner used to retrieve data from mobile phones. Its products are widely deployed by police across 32 of China's 33 provinces. Procurement records show major city police departments, including Beijing and Shanghai, have invested heavily in these tools. Zhongke Ronghui's technologies support real-time data collection, social monitoring, and integration with broader surveillance systems such as facial recognition and AI-driven analytics.

Zignal Labs

Zignal Labs is a San Francisco-based big data analytics company that develops real-time media monitoring and business intelligence tools. Founded by Josh Grinsberg, the company enables clients to monitor, analyze and organize data from social media and other online platforms. In partnership with Qorvis Communications, a long-standing lobbying firm for Saudi Arabia, Zignal Labs has been contracted to provide surveillance activities on behalf of the Royal Embassy of Saudi Arabia.

In October 2025, it was revealed that ICE signed a $5.7 million contract for licenses to Zignal Labs' software. The platform is also utilized by the Israeli military and the Pentagon.

Nitro

These attackers were the subject of an extensive report by Symantec in 2011, which termed the

attackers Nitro and stated: 'The goal of the attackers appears to be to collect intellectual property such as design documents, formulas, and manufacturing processes. In addition, the same attackers appear to have a lengthy operation history including attacks on other industries and organizations. Attacks on the chemical industry are merely their latest attack wave. As part of our investigations, we were also able to identify and contact one of the attackers to try and gain insights into the motivations behind these attacks.' Palo Alto Networks reported on continued activity by the attackers in 2014.

Grayling

Grayling activity was first observed in early 2023, when a number of victims were identified with distinctive malicious DLL side-loading activity. Grayling appears to target organisations in Asia, however one unknown organisation in the United States was also targeted. Industries targeted include Biomedical, Government and Information Technology. Grayling use a variety of tools during their attacks, including well known tools such as Cobalt Strike and Havoc and also some others.

Storm-2603

The group Microsoft tracks as Storm-2603 is assessed with medium confidence to be a China-based threat actor. Microsoft has not identified links between Storm-2603 and other known Chinese threat actors. Microsoft tracks this threat actor in association with attempts to steal MachineKeys via the on-premises SharePoint vulnerabilities. Although Microsoft has observed this threat actor deploying Warlock and Lockbit ransomware in the past, Microsoft is currently unable to confidently assess the threat actor's objectives. Additional actors may use these exploits to target unpatched on-premises SharePoint systems, further emphasizing the need for organizations to implement mitigations and security updates immediately.

The tag is: *misp-galaxy:threat-actor="Storm-2603"*

DarkHotel

Kaspersky described DarkHotel in a 2014 report as: '... DarkHotel drives its campaigns by spear-phishing targets with highly advanced Flash zero-day exploits that effectively evade the latest Windows and Adobe defenses, and yet they also imprecisely spread among large numbers of vague targets with peer-to-peer spreading tactics. Moreover, this crews most unusual characteristic is that for several years the Darkhotel APT has maintained a capability to use hotel networks to follow and hit selected targets as they travel around the world.'

APT16

Between November 26, 2015, and December 1, 2015, known and suspected China-based APT groups launched several spear-phishing attacks targeting Japanese and Taiwanese organizations in the high-tech, government services, media and financial services industries. Each campaign delivered a malicious Microsoft Word document exploiting the aforementioned EPS dict copy use-after-free vulnerability, and the local Windows privilege escalation vulnerability CVE-2015-1701. The successful exploitation of both vulnerabilities led to the delivery of either a downloader that we refer to as IRONHALO, or a backdoor that we refer to as ELMER.

Naikon

Kaspersky described Naikon in a 2015 report as: 'The Naikon group is mostly active in countries

such as the Philippines, Malaysia, Cambodia, Indonesia, Vietnam, Myanmar, Singapore, and Nepal, hitting a variety of targets in a very opportunistic way.'

The tag is: *misp-galaxy:threat-actor="Naikon"*

Naikon is also known as:

- PLA Unit 78020
- OVERRIDE PANDA
- Camerashy
- BRONZE GENEVA
- G0019
- Naikon
- BRONZE STERLING
- G0013

View relationships graph

Naikon has relationships with:

- similar: misp-galaxy:mitre-intrusion-set="Naikon - G0019" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:mitre-intrusion-set="APT30 - G0013" with estimative-language:likelihood-probability="likely"

HURRICANE PANDA

We have investigated their intrusions since 2013 and have been battling them nonstop over the last year at several large telecommunications and technology companies. The determination of this China-based adversary is truly impressive: they are like a dog with a bone. HURRICANE PANDA's preferred initial vector of compromise and persistence is a China Chopper webshell – a tiny and easily obfuscated 70 byte text file that consists of an 'eval()' command, which is then used to

provide full command execution and file upload/download capabilities to the attackers. This script is typically uploaded to a web server via a SQL injection or WebDAV vulnerability, which is often trivial to uncover in a company with a large external web presence. Once inside, the adversary immediately moves on to execution of a credential theft tool such as Mimikatz (repacked to avoid AV detection). If they are lucky to have caught an administrator who might be logged into that web server at the time, they will have gained domain administrator credentials and can now roam your network at will via 'net use' and 'wmic' commands executed through the webshell terminal.

APT14

PLA Navy Anchor Panda is an adversary that CrowdStrike has tracked extensively over the last year targeting both civilian and military maritime operations in the green/brown water regions primarily in the area of operations of the South Sea Fleet of the PLA Navy. In addition to maritime operations in this region, Anchor Panda also heavily targeted western companies in the US, Germany, Sweden, the UK, and Australia, and other countries involved in maritime satellite systems, aerospace companies, and defense contractors. Not surprisingly, embassies and diplomatic missions in the region, foreign intelligence services, and foreign governments with space programs were also targeted.

The tag is: *misp-galaxy:threat-actor="APT14"*

IMPERSONATING PANDA

The tag is: *misp-galaxy:threat-actor="IMPERSONATING PANDA"*

APT20

We’ve uncovered some new data and likely attribution regarding a series of APT watering hole attacks this past summer. Watering hole attacks are an increasingly popular component of APT campaigns, as many people are more aware of spear phishing and are less likely to open documents or click on links in unsolicited emails. Watering hole attacks offer a much better chance of success because they involve compromising legitimate websites and installing malware intended to compromise website visitors. These are often popular websites frequented by people who work

in specific industries or have political sympathies to which the actors want to gain access. In contrast to many other APT campaigns, which tend to rely heavily on spear phishing to gain victims, “th3bug” is known for compromising legitimate websites their intended visitors are likely to frequent. Over the summer they compromised several sites, including a well-known Uyghur website written in that native language.

The tag is: *misp-galaxy:threat-actor="APT20"*

APT20 is also known as:

- VIOLIN PANDA
- TH3Bug
- Crawling Taurus

TEMPER PANDA

China-based cyber threat group. It has previously used newsworthy events as lures to deliver malware and has primarily targeted organizations involved in financial, economic, and trade policy, typically using publicly available RATs such as PoisonIvy, as well as some non-public backdoors. This threat actor targets prodemocratic activists and organizations in Hong Kong, European and international financial institutions, and a U.S.-based think tank.

The tag is: *misp-galaxy:threat-actor="TEMPER PANDA"*

TEMPER PANDA is also known as:

- Admin338
- Team338
- MAGNESIUM
- admin@338
- G0018

APT23

TrendMicro described Tropic Trooper in a 2015 report as: 'Taiwan and the Philippines have become the targets of an ongoing campaign called Operation TropicTrooper. Active since 2012, the attackers behind the campaign haveset their sights on the Taiwanese government as well as a number of companies in the heavy industry. The same campaign has also targeted key Philippine military agencies.'

The tag is: *misp-galaxy:threat-actor="APT23"*

APT23 is also known as:

APT29

A 2015 report by F-Secure describe APT29 as: 'The Dukes are a well-resourced, highly dedicated and organized cyberespionage group that we believe has been working for the Russian Federation since at least 2008 to collect intelligence in support of foreign and security policy decision-making. The Dukes show unusual confidence in their ability to continue successfully compromising their targets, as well as in their ability to operate with impunity. The Dukes primarily target Western governments and related organizations, such as government ministries and agencies, political think tanks, and governmental subcontractors. Their targets have also included the governments of members of the Commonwealth of Independent States;Asian, African, and Middle Eastern governments;organizations associated with Chechen extremism;and Russian speakers engaged in the illicit trade of controlled substances and drugs. The Dukes are known to employ a vast arsenal of malware toolsets, which we identify as MiniDuke, CosmicDuke, OnionDuke, CozyDuke, CloudDuke, SeaDuke, HammerDuke, PinchDuke, and GeminiDuke. In recent years, the Dukes have engaged in apparently biannual large - scale spear - phishing campaigns against hundreds or even thousands of recipients associated with governmental institutions and affiliated organizations. These campaigns utilize a smash - and - grab approach involving a fast but noisy breakin followed by the rapid collection and exfiltration of as much data as possible.If the compromised target is discovered to be of value, the Dukes will quickly switch the toolset used and move to using stealthier tactics focused on persistent compromise and long - term intelligence gathering. This threat actor targets government ministries and agencies in the West, Central Asia, East Africa, and the Middle East; Chechen extremist groups; Russian organized crime; and think tanks. It is suspected to be behind the 2015 compromise of unclassified networks at the White House, Department of State, Pentagon, and the Joint Chiefs of Staff. The threat actor includes all of the Dukes tool sets, including MiniDuke, CosmicDuke, OnionDuke, CozyDuke, SeaDuke, CloudDuke (aka MiniDionis), and HammerDuke (aka Hammertoss). '

Turla

A 2014 Guardian article described Turla as: 'Dubbed the Turla hackers, initial intelligence had indicated western powers were key targets, but it was later determined embassies for Eastern Bloc nations were of more interest. Embassies in Belgium, Ukraine, China, Jordan, Greece, Kazakhstan, Armenia, Poland, and Germany were all attacked, though researchers from Kaspersky Lab and Symantec could not confirm which countries were the true targets. In one case from May 2012, the office of the prime minister of a former Soviet Union member country was infected, leading to 60 further computers being affected, Symantec researchers said. There were some other victims, including the ministry for health of a Western European country, the ministry for education of a Central American country, a state electricity provider in the Middle East and a medical organisation in the US, according to Symantec. It is believed the group was also responsible for a much - documented 2008 attack on the US Central Command. The attackers - who continue to operate - have ostensibly sought to carry out surveillance on targets and pilfer data, though their use of encryption across their networks has made it difficult to ascertain exactly what the hackers took.Kaspersky Lab, however, picked up a number of the attackers searches through their victims emails, which included terms such as Nato and EU energy dialogue Though attribution is difficult to substantiate, Russia has previously been suspected of carrying out the attacks and Symantecs Gavin O' Gorman told the Guardian a number of the hackers appeared to be using Russian names and language in their notes for their malicious code. Cyrillic was also seen in use.'

Sandworm

This threat actor targets industrial control systems, using a tool called Black Energy, associated with electricity and power generation for espionage, denial of service, and data destruction purposes. Some believe that the threat actor is linked to the 2015 compromise of the Ukrainian electrical grid and a distributed denial of service prior to the Russian invasion of Georgia. Believed to be responsible for the 2008 DDoS attacks in Georgia and the 2015 Ukraine power grid outage

TeamSpy Crew

Researchers have uncovered a long-term cyber-espionage campaign that used a combination of legitimate software packages and commodity malware tools to target a variety of heavy industry, government intelligence agencies and political activists. Known as the TeamSpy crew because of its affinity for using the legitimate TeamViewer application as part of its toolset, the attackers may have been active for as long as 10 years, researchers say. The attack appears to be a years-long espionage campaign, but experts who have analyzed the victim profile, malware components and command-and-control infrastructure say that it's not entirely clear what kind of data the attackers are going after. What is clear, though, is that the attackers have been at this for a long time and that they have specific people in mind as targets. Researchers at the CrySyS Lab in Hungary were alerted by the Hungarian National Security Authority to an attack against a high-profile target in the country and began looking into the campaign. They quickly discovered that some of the

infrastructure being used in the attack had been in use for some time and that the target they were investigating was by no means the only one.

The tag is: *misp-galaxy:threat-actor="TeamSpy Crew"*

TeamSpy Crew is also known as:

- TeamSpy
- Team Bear
- Anger Bear
- IRON LYRIC

BuhTrap

Buhtrap has been active since 2014, however their first attacks against financial institutions were only detected in August 2015. Earlier, the group had only focused on targeting banking clients. At the moment, the group is known to target Russian and Ukrainian banks. From August 2015 to February 2016 Buhtrap managed to conduct 13 successful attacks against Russian banks for a total amount of 1.8 billion rubles ($25.7 mln). The number of successful attacks against Ukrainian banks has not been identified. Buhtrap is the first hacker group using a network worm to infect the overall bank infrastructure that significantly increases the difficulty of removing all malicious functions from the network. As a result, banks have to shut down the whole infrastructure which provokes delay in servicing customers and additional losses. Malicious programs intentionally scan for machines with an automated Bank-Customer system of the Central Bank of Russia (further referred to as BCS CBR). We have not identified incidents of attacks involving online money transfer systems, ATM machines or payment gates which are known to be of interest for other criminal groups.

Silent Chollima

Andariel is a threat actor that primarily targets South Korean corporations and institutions. They are believed to collaborate with or operate as a subsidiary organization of the Lazarus threat group. WHOIS utilizes spear phishing attacks, watering hole attacks, and supply chain attacks for initial access. They have been known to exploit vulnerabilities and use malware such as Infostealer and TigerRAT.

Lazarus Group

Since 2009, HIDDEN COBRA actors have leveraged their capabilities to target and compromise a range of victims; some intrusions have resulted in the exfiltration of data while others have been disruptive in nature. Commercial reporting has referred to this activity as Lazarus Group and Guardians of Peace. Tools and capabilities used by HIDDEN COBRA actors include DDoS botnets, keyloggers, remote access tools (RATs), and wiper malware. Variants of malware and tools used by HIDDEN COBRA actors include Destover, Duuzer, and Hangman.

VICEROY TIGER

VICEROY TIGER is an adversary with a nexus to India that has historically targeted entities throughout multiple sectors. Older activity targeted multiple sectors and countries; however, since 2015 this adversary appears to focus on entities in Pakistan with a particular focus on government and security organizations. This adversary consistently leverages spear phishing emails containing malicious Microsoft Office documents, malware designed to target the Android mobile platform, and phishing activity designed to harvest user credentials. In March 2017, the 360 Chasing Team found a sample of targeted attacks that confirmed the previously unknown sample of APT's attack actions, which the organization can now trace back at least in April 2016. The chasing team named the attack organization APT-C-35. In June 2017, the 360 Threat Intelligence Center discovered the

organization's new attack activity, confirmed and exposed the gang's targeted attacks against Pakistan, and analyzed in detail. The unique EHDevel malicious code framework used by the organization.

SNOWGLOBE

In 2014, researchers at Kaspersky Lab discovered and reported on three zero-days that were being used in cyberattacks in the wild. Two of these zero-day vulnerabilities are associated with an advanced threat actor we call Animal Farm. Over the past few years, Animal Farm has targeted a wide range of global organizations. The group has been active since at least 2009 and there are signs that earlier malware versions were developed as far back as 2007.

Deadeye Jackal

The Syrian Electronic Army (SEA) is a group of computer hackers which first surfaced online in 2011 to support the government of Syrian President Bashar al-Assad. Using spamming, website defacement, malware, phishing, and denial of service attacks, it has targeted political opposition groups, western news organizations, human rights groups and websites that are seemingly neutral to the Syrian conflict. It has also hacked government websites in the Middle East and Europe, as well as US defense contractors. As of 2011 the SEA has been **the first Arab country to have a public Internet Army hosted on its national networks to openly launch cyber attacks on its enemies**. The precise nature of SEA's relationship with the Syrian government has changed over time and is unclear

Scarlet Mimic

Scarlet Mimic is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group's motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by Scarlet Mimic and Putter Panda, APT 2, it has not been concluded that the groups are the same. The attacks began over four years ago and their targeting pattern suggests that this adversary's primary mission is to gather information about minority rights activists. We do not have evidence directly linking these attacks to a government source, but the information derived from these activities supports an assessment that a group or groups with motivations similar to the stated position of the Chinese government in relation to these targets is involved. The attacks we attribute to Scarlet Mimic have primarily targeted Uyghur and Tibetan activists as well as those who are interested in their causes. Both the Tibetan community and the Uyghurs, a Turkic Muslim minority residing primarily in northwest China, have been targets of multiple sophisticated attacks in the past decade. Both also have history of strained relationships with the government of the People's Republic of China (PRC), though we do not have evidence that links Scarlet Mimic attacks to the PRC. Scarlet Mimic attacks have also been identified against government organizations in Russia and India, who are responsible for tracking activist and terrorist activities. While we do not know the precise target of each of the Scarlet Mimic attacks, many of them align to the patterns described above.

ProjectSauron

ProjectSauron is the name for a top level modular cyber-espionage platform, designed to enable and manage long-term campaigns through stealthy survival mechanisms coupled with multiple exfiltration methods. Technical details show how attackers learned from other extremely advanced actors in order to avoid repeating their mistakes. As such, all artifacts are customized per given target, reducing their value as indicators of compromise for any other victim. Usually APT campaigns have a geographical nexus, aimed at extracting information within a specific region or

from a given industry. That usually results in several infections in countries within that region, or in the targeted industry around the world. Interestingly, ProjectSauron seems to be dedicated to just a couple of countries, focused on collecting high value intelligence by compromising almost all key entities it could possibly reach within the target area. The name, ProjectSauron reflects the fact that the code authors refer to 'Sauron' in the Lua scripts.

OilRig

OilRig is an Iranian threat group operating primarily in the Middle East by targeting organizations in this region that are in a variety of different industries; however, this group has occasionally targeted organizations outside of the Middle East as well. It also appears OilRig carries out supply

chain attacks, where the threat group leverages the trust relationship between organizations to attack their primary targets.

OilRig is an active and organized threat group, which is evident based on their systematic targeting of specific organizations that appear to be carefully chosen for strategic purposes. Attacks attributed to this group primarily rely on social engineering to exploit the human rather than software vulnerabilities; however, on occasion this group has used recently patched vulnerabilities in the delivery phase of their attacks. The lack of software vulnerability exploitation does not necessarily suggest a lack of sophistication, as OilRig has shown maturity in other aspects of their operations. Such maturities involve:

-Organized evasion testing used the during development of their tools. -Use of custom DNS Tunneling protocols for command and control (C2) and data exfiltration. -Custom web-shells and backdoors used to persistently access servers.

OilRig relies on stolen account credentials for lateral movement. After OilRig gains access to a system, they use credential dumping tools, such as Mimikatz, to steal credentials to accounts logged into the compromised system. The group uses these credentials to access and to move laterally to other systems on the network. After obtaining credentials from a system, operators in this group prefer to use tools other than their backdoors to access the compromised systems, such as remote desktop and putty. OilRig also uses phishing sites to harvest credentials to individuals at targeted organizations to gain access to internet accessible resources, such as Outlook Web Access.

Since at least 2014, an Iranian threat group tracked by FireEye as APT34 has conducted reconnaissance aligned with the strategic interests of Iran. The group conducts operations primarily in the Middle East, targeting financial, government, energy, chemical, telecommunications and other industries. Repeated targeting of Middle Eastern financial, energy and government organizations leads FireEye to assess that those sectors are a primary concern of APT34. The use of infrastructure tied to Iranian operations, timing and alignment with the national interests of Iran also lead FireEye to assess that APT34 acts on behalf of the Iranian government.

Molerats

In October 2012, malware attacks against Israeli government targets grabbed media attention as officials temporarily cut off Internet access for its entire police force and banned the use of USB memory sticks. Security researchers subsequently linked these attacks to a broader, yearlong campaign that targeted not just Israelis but Palestinians as well. and as discovered later, even the U.S. and UK governments. Further research revealed a connection between these attacks and members of the so-called "Gaza Hackers Team." We refer to this campaign as "Molerats."

The tag is: *misp-galaxy:threat-actor="Molerats"*

PROMETHIUM

PROMETHIUM is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.

Packrat

A threat group that has been active for at least seven years has used malware, phishing and disinformation tactics to target activists, journalists, politicians and public figures in various Latin American countries. The threat actor, dubbed Packrat based on its preference for remote access Trojans (RATs) and because it has used the same infrastructure for several years, has been analyzed by Citizen Lab researchers John Scott-Railton, Morgan Marquis-Boire, and Claudio Guarnieri, and Cyphort researcher Marion Marschalek, best known for her extensive analysis of state-sponsored threats.

The tag is: *misp-galaxy:threat-actor="Packrat"*

Table 18191. Table References

PassCV

The PassCV group continues to be one of the most successful and active threat groups that leverage a wide array of stolen Authenticode-signing certificates. Snorre Fagerland of Blue Coat Systems first coined the term PassCV in a blog post. His post provides a good introduction to the group and covers some of the older infrastructure, stolen code-signing certificate reuse, and other connections associated with the PassCV malware. There are several clues alluding to the possibility that multiple groups may be utilizing the same stolen signing certificates, but at this time SPEAR believes the current attacks are more likely being perpetrated by a single group employing multiple publicly available Remote Administration Tools (RATs). The PassCV group has been operating with continued success and has already started to expand their malware repertoire into different off-the-shelf RATs and custom code. SPEAR identified eighteen previously undisclosed stolen Authenticode certificates. These certificates were originally issued to companies and individuals scattered across China, Taiwan, Korea, Europe, the United States and Russia. In this post we expand the usage of the term 'PassCV' to encompass the malware mentioned in the Blue Coat Systems report, as well as the APT group behind the larger C2 infrastructure and stolen Authenticode certificates. We'd like to share some of our findings as they pertain to the stolen certificates, command and control infrastructure, and some of the newer custom RATs they've begun development on.

The tag is: *misp-galaxy:threat-actor="PassCV"*

- Phantom Turk

Ayyıldız Tim

Ayyıldız (Crescent and Star) Tim is a nationalist hacking group founded in 2002. It performs defacements and DDoS attacks against the websites of governments that it considers to be repressing Muslim minorities or engaged in Islamophobic policies.

The tag is: *misp-galaxy:threat-actor="Ayyıldız Tim"*

Ayyıldız Tim is also known as:

- Crescent and Star

TurkHackTeam

Founded in 2004, Turkhackteam is one of Turkey's oldest and most high-profile hacking collectives. According to a list compiled on Turkhackteam's forum, the group has carried out almost 30 highly publicized hacking campaigns targeting foreign government and commercial websites, including websites of international corporations.

Gamaredon Group

Unit 42 threat researchers have recently observed a threat group distributing new, custom developed malware. We have labelled this threat group the Gamaredon Group and our research shows that the Gamaredon Group has been active since at least 2013. In the past, the Gamaredon Group has relied heavily on off-the-shelf tools. Our new research shows the Gamaredon Group have made a shift to custom-developed malware. We believe this shift indicates the Gamaredon Group have improved their technical capabilities.

The tag is: *misp-galaxy:threat-actor="Gamaredon Group"*

Gamaredon Group is also known as:

Infy

Infy is a group of suspected Iranian origin. Since early 2013, we have observed activity from a unique threat actor group, which we began to investigate based on increased activities against human right activists in the beginning of 2015. In line5with other research on the campaign, released prior to publication of this document, we have adopted the name “Infy”, which is based on labels used in the infrastructure and its two families of malware agents. Thanks to information we have been able to collect during the course of our research, such as characteristics of the group’s malware and development cycle, our research strongly supports the claim that the Infy group is of Iranian origin and potentially connected to the Iranian state. Amongst a backdrop of other incidents, Infy became one of the most frequently observed agents for attempted malware attacks

against Iranian civil society beginning in late 2014, growing in use up to the February 2016 parliamentary election in Iran. After the conclusion of the parliamentary election, the rate of attempted intrusions and new compromises through the Infy agent slowed, but did not end. The trends witnessed in reports from recipients are reinforced through telemetry provided by design failures in more recent versions of the Infy malware.

The tag is: *misp-galaxy:threat-actor="Infy"*

Infy is also known as:

- Operation Mermaid
- Prince of Persia
- Foudre

Sima

Sima is a group of suspected Iranian origin targeting Iranians in diaspora. In February 2016, Iran-focused individuals received messages purporting to be from Human RightsWatch's (HRW) Emergencies Director, requesting that they read an article about Iran pressing Afghanr efugees to fight in Syria. While referencing a real report published by HRW, the links provided for the Director's biography and article directed the recipient to malware hosted elsewhere. These spear-phishing attempts represent an evolution of Iranian actors based on their social engineering tactics and narrow targeting. Although the messages still had minor grammatical and stylistic errors that would be obvious to a native speaker, the actors demonstrated stronger English-language proficiency than past intrusion sets and a deeper investment in background research prior to the attempt. The actors appropriated a real identity that would be expected to professionally interact

with the subject, then offered validation through links to their biography and social media, the former of which itself was malware as well. The bait documents contained a real article relevant to their interests and topic referenced, and the message attempted to address to how it aligned with their professional research or field of employment. The referenced documents sent were malware binaries posing as legitimate files using the common right-to-left filenames tactic in order to conceal the actual file extension. All of these techniques, while common pretexting mechanisms, are a refinement compared to a tendency amongst other groups to simply continually send different forms of generic malware or phishing, in the hopes that one would eventually be successful.

Longhorn

Longhorn has been active since at least 2011. It has used a range of back door Trojans in addition to zero-day vulnerabilities to compromise its targets. Longhorn has infiltrated governments and internationally operating organizations, in addition to targets in the financial, telecoms, energy, aerospace, information technology, education, and natural resources sectors. All of the organizations targeted would be of interest to a nation-state attacker. Longhorn has infected 40 targets in at least 16 countries across the Middle East, Europe, Asia, and Africa. On one occasion a computer in the United States was compromised but, following infection, an uninstaller was launched within hours, which may indicate this victim was infected unintentionally. According to cfr, this threat actor compromises governments, international organizations, academic institutions, and financial, telecommunications, energy, aerospace, information technology, and natural resource industries for espionage purposes. Some of the tools used by this threat actor were released by Wikileaks under the name "Vault 7."

WildNeutron

A corporate espionage group has compromised a string of major corporations over the past three years in order to steal confidential information and intellectual property. The gang, which Symantec calls Butterfly, is not-state sponsored, rather financially motivated. It has attacked multi-billion dollar companies operating in the internet, IT software, pharmaceutical, and commodities sectors. Twitter, Facebook, Apple, and Microsoft are among the companies who have publicly acknowledged attacks. Butterfly is technically proficient and well resourced. The group has developed a suite of custom malware tools capable of attacking both Windows and Apple computers, and appears to have used at least one zero-day vulnerability in its attacks. It keeps a low profile and maintains good operational security. After successfully compromising a target organization, it cleans up after itself before moving on to its next target. This group operates at a much higher level than the average cybercrime gang. It is not interested in stealing credit card details or customer databases and is instead focused on high-level corporate information. Butterfly may be selling this information to the highest bidder or may be operating as hackers for hire. Stolen information could also be used for insider-trading purposes.

The tag is: *misp-galaxy:threat-actor="WildNeutron"*

WildNeutron is also known as:

- Butterfly
- Morpho
- Sphinx Moth

PLATINUM

PLATINUM has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, PLATINUM seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group's persistent use of spear phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly resilient threat.

RASPITE

Dragos has identified a new activity group targeting access operations in the electric utility sector. We call this activity group RASPITE. Analysis of RASPITE tactics, techniques, and procedures (TTPs) indicate the group has been active in some form since early- to mid-2017. RASPITE targeting includes entities in the US, Middle East, Europe, and East Asia. Operations against electric utility organizations appear limited to the US at this time. RASPITE leverages strategic website compromise to gain initial access to target networks. RASPITE uses the same methodology as DYMALLOY and ALLANITE in embedding a link to a resource to prompt an SMB connection, from which it harvests Windows credentials. The group then deploys install scripts for a malicious service to beacon back to RASPITE-controlled infrastructure, allowing the adversary to remotely access the victim machine.

Tonto Team

Tonto Team is a Chinese-speaking APT group that has been active since at least 2013. They primarily target military, diplomatic, and infrastructure organizations in Asia and Eastern Europe. The group has been observed using various malware, including the Bisonal RAT and ShadowPad. They employ spear-phishing emails with malicious attachments as their preferred method of distribution.

APT5

We have observed one APT group, which we call APT5, particularly focused on telecommunications and technology companies. More than half of the organizations we have observed being targeted or breached by APT5 operate in these sectors. Several times, APT5 has targeted organizations and personnel based in Southeast Asia. APT5 has been active since at least 2007. It appears to be a large threat group that consists of several subgroups, often with distinct tactics and infrastructure. APT5 has targeted or breached organizations across multiple industries, but its focus appears to be on telecommunications and technology companies, especially information about satellite communications. APT5 targeted the network of an electronics firm that sells products for both industrial and military applications. The group subsequently stole communications related to the firm's business relationship with a national military, including inventories and memoranda about specific products they provided. In one case in late 2014, APT5 breached the network of an international telecommunications company. The group used malware with keylogging capabilities to monitor the computer of an executive who manages the company's relationships with other telecommunications companies

Tick

Tick is a cyber espionage group with likely Chinese origins that has been active since at least 2008. The group appears to have close ties to the Chinese National University of Defense and Technology, which is possibly linked to the PLA. This threat actor targets organizations in the critical infrastructure, heavy industry, manufacturing, and international relations sectors for espionage purposes. The attacks appear to be centered on political, media, and engineering sectors. STALKER PANDA has been observed conducting targeted attacks against Japan, Taiwan, Hong Kong, and the United States.

Madi

Kaspersky Lab and Seculert worked together to sinkhole the Madi Command & Control (C&C) servers to monitor the campaign. Kaspersky Lab and Seculert identified more than 800 victims located in Iran, Israel and select countries across the globe connecting to the C&Cs over the past eight months. Statistics from the sinkhole revealed that the victims were primarily business people working on Iranian and Israeli critical infrastructure projects, Israeli financial institutions, Middle Eastern engineering students, and various government agencies communicating in the Middle East. Common applications and websites that were spied on include accounts on Gmail, Hotmail, Yahoo! Mail, ICQ, Skype, Google+, and Facebook. Surveillance is also performed over integrated ERP/CRM systems, business contracts, and financial management systems.

Snake Wine

While investigating some of the smaller name servers that APT28/Sofacy routinely use to host their infrastructure, Cylance discovered another prolonged campaign that appeared to exclusively target Japanese companies and individuals that began around August 2016. The later registration style was eerily close to previously registered APT28 domains, however, the malware used in the attacks did not seem to line up at all. During the course of our investigation, JPCERT published this analysis of one of the group's backdoors. Cylance tracks this threat group internally as 'Snake Wine'. The Snake Wine group has proven to be highly adaptable and has continued to adopt new tactics in order to establish footholds inside victim environments. The exclusive interest in Japanese government, education, and commerce will likely continue into the future as the group is just starting to build and utilize their existing current attack infrastructure.

Careto

This threat actor targets governments, diplomatic missions, private companies in the energy sector, and academics for espionage purposes. The Mask is an advanced threat actor that has been involved in cyber-espionage operations since at least 2007. The name "Mask" comes from the Spanish slang word "Careto" ("Ugly Face" or "Mask") which the authors included in some of the malware modules. More than 380 unique victims in 31 countries have been observed to date.What makes "The Mask" special is the complexity of the toolset used by the attackers. This includes an extremely sophisticated malware, a rootkit, a bootkit, 32-and 64-bit Windows versions, Mac OS X and Linux versions and possibly versions for Android and iPad/iPhone (Apple iOS).

APT6

The FBI issued a rare bulletin admitting that a group named Advanced Persistent Threat 6 (APT6) hacked into US government computer systems as far back as 2011 and for years stole sensitive data. The FBI alert was issued in February and went largely unnoticed. Nearly a month later, security experts are now shining a bright light on the alert and the mysterious group behind the attack. “This is a rare alert and a little late, but one that is welcomed by all security vendors as it offers a chance to mitigate their customers and also collaborate further in what appears to be an ongoing FBI investigation,” said Deepen Desai, director of security research at the security firm Zscaler in an email to Threatpost. Details regarding the actual attack and what government systems were

infected are scant. Government officials said they knew the initial attack occurred in 2011, but are unaware of who specifically is behind the attacks. “Given the nature of malware payload involved and the duration of this compromise being unnoticed – the scope of lateral movement inside the compromised network is very high possibly exposing all the critical systems,”Deepen said.

AridViper

AridViper is a state-sponsored APT primarily targeting military personnel, journalists, and dissidents in the Middle East, with a focus on Israel and Palestine. The group employs custom-developed mobile malware, including variants like AridSpy, GnatSpy, and Micropsia, often delivered through spear-phishing emails and deceptive applications. Their operations involve sophisticated social engineering tactics, including the use of fake social media profiles and weaponized apps masquerading as legitimate services. AridViper’s activities are characterized by a blend of technical sophistication and psychological manipulation, aiming to exfiltrate sensitive data from compromised systems.

White Bear

As a part of our Kaspersky APT Intelligence Reporting subscription, customers received an update in mid-February 2017 on some interesting APT activity that we called WhiteBear. Much of the contents of that report are reproduced here. WhiteBear is a parallel project or second stage of the Skipper Turla cluster of activity documented in another private intelligence report “Skipper Turla – the White Atlas framework” from mid-2016. Like previous Turla activity, WhiteBear leverages compromised websites and hijacked satellite connections for command and control (C2)

infrastructure. As a matter of fact, WhiteBear infrastructure has overlap with other Turla campaigns, like those deploying Kopiluwak, as documented in “KopiLuwak – A New JavaScript Payload from Turla” in December 2016. WhiteBear infected systems maintained a dropper (which was typically signed) as well as a complex malicious platform which was always preceded by WhiteAtlas module deployment attempts. However, despite the similarities to previous Turla campaigns, we believe that WhiteBear is a distinct project with a separate focus. We note that this observation of delineated target focus, tooling, and project context is an interesting one that also can be repeated across broadly labeled Turla and Sofacy activity. From February to September 2016, WhiteBear activity was narrowly focused on embassies and consular operations around the world. All of these early WhiteBear targets were related to embassies and diplomatic/foreign affair organizations. Continued WhiteBear activity later shifted to include defense-related organizations into June 2017. When compared to WhiteAtlas infections, WhiteBear deployments are relatively rare and represent a departure from the broader Skipper Turla target set. Additionally, a comparison of the WhiteAtlas framework to WhiteBear components indicates that the malware is the product of separate development efforts. WhiteBear infections appear to be preceded by a condensed spearphishing dropper, lack Firefox extension installer payloads, and contain several new components signed with a new code signing digital certificate, unlike WhiteAtlas incidents and modules.

Orangeworm

Symantec has identified a previously unknown group called Orangeworm that has been observed installing a custom backdoor called Trojan.Kwampirs within large international corporations that operate within the healthcare sector in the United States, Europe, and Asia. First identified in January 2015, Orangeworm has also conducted targeted attacks against organizations in related industries as part of a larger supply-chain attack in order to reach their intended victims. Known victims include healthcare providers, pharmaceuticals, IT solution providers for healthcare and equipment manufacturers that serve the healthcare industry, likely for the purpose of corporate espionage.

ALLANITE

Adversaries abusing ICS (based on Dragos Inc adversary list). ALLANITE accesses business and industrial control (ICS) networks, conducts reconnaissance, and gathers intelligence in United States and United Kingdom electric utility sectors. Dragos assesses with moderate confidence that ALLANITE operators continue to maintain ICS network access to: (1) understand the operational environment necessary to develop disruptive capabilities, (2) have ready access from which to

disrupt electric utilities. ALLANITE uses email phishing campaigns and compromised websites called watering holes to steal credentials and gain access to target networks, including collecting and distributing screenshots of industrial control systems. ALLANITE operations limit themselves to information gathering and have not demonstrated any disruptive or damaging capabilities. ALLANITE conducts malware-less operations primarily leveraging legitimate and available tools in the Windows operating system.

RANCOR

The Rancor group's attacks use two primary malware families which are naming DDKONG and PLAINTEE. DDKONG is used throughout the campaign and PLAINTEE appears to be new addition to these attackers' toolkit. Countries Unit 42 has identified as targeted by Rancor with these malware families include, but are not limited to Singapore and Cambodia.

The tag is: *misp-galaxy:threat-actor="RANCOR"*

RANCOR is also known as:

- Rancor group
- Rancor
- Rancor Group
- G0075
- Rancor Taurus

The Big Bang

While it is not clear exactly what the attacker is looking for, what is clear is that once he finds it, a second stage of the attack awaits, fetching additional modules and/or malware from the Command and Control server. This then is a surveillance attack in progress and has been dubbed 'Big Bang' due to the attacker's fondness for the 'Big Bang Theory' TV show, after which some of the malware's modules are named.

The Gorgon Group

Unit 42 researchers have been tracking Subaat, an attacker, since 2017. Recently Subaat drew our

attention due to renewed targeted attack activity. Part of monitoring Subaat included realizing the actor was possibly part of a larger crew of individuals responsible for carrying out targeted attacks against worldwide governmental organizations. Technical analysis on some of the attacks as well as attribution links with Pakistan actors have been already depicted by 360 and Tuisec, in which they found interesting connections to a larger group of attackers Unit 42 researchers have been tracking, which we are calling Gorgon Group.

The tag is: *misp-galaxy:threat-actor="The Gorgon Group"*

The Gorgon Group is also known as:

- Gorgon Group
- Subaat
- ATK92
- G0078
- Pasty Gemini

DarkHydrus

In July 2018, Unit 42 analyzed a targeted attack using a novel file type against at least one government agency in the Middle East. It was carried out by a previously unpublished threat group we track as DarkHydrus. Based on our telemetry, we were able to uncover additional artifacts leading us to believe this adversary group has been in operation with their current playbook since early 2016. This attack diverged from previous attacks we observed from this group as it involved spear-phishing emails sent to targeted organizations with password protected RAR archive attachments that contained malicious Excel Web Query files (.iqy).

The tag is: *misp-galaxy:threat-actor="DarkHydrus"*

DarkHydrus is also known as:

- LazyMeerkat
- G0079
- Obscure Serpens

RedAlpha

Recorded Future's Insikt Group has identified two new cyberespionage campaigns targeting the Tibetan Community over the past two years. The campaigns, which we are collectively naming RedAlpha, combine light reconnaissance, selective targeting, and diverse malicious tooling. We discovered this activity as the result of pivoting off of a new malware sample observed targeting the Tibetan community based in India.

The tag is: *misp-galaxy:threat-actor="RedAlpha"*

RedAlpha is also known as:

- DeepCliff
- Red Dev 3

Operation Parliament

This threat actor uses spear-phishing techniques to target parliaments, government ministries, academics, and media organizations, primarily in the Middle East, for the purpose of espionage. Based on our findings, we believe the attackers represent a previously unknown geopolitically motivated threat actor. The campaign started in 2017, with the attackers doing just enough to achieve their goals. They most likely have access to additional tools when needed and appear to have access to an elaborate database of contacts in sensitive organizations and personnel worldwide, especially of vulnerable and non-trained staff. The victim systems range from personal desktop or laptop systems to large servers with domain controller roles or similar. The nature of the targeted ministries varied, including those responsible for telecommunications, health, energy, justice, finance and so on. Operation Parliament appears to be another symptom of escalating tensions in the Middle East region. The attackers have taken great care to stay under the radar, imitating another attack group in the region. They have been particularly careful to verify victim devices before proceeding with the infection, safeguarding their command and control servers. The targeting seems to have slowed down since the beginning of 2018, probably winding down when the desired data or access was obtained. The targeting of specific victims is unlike previously seen behavior in regional campaigns by Gaza Cybergang or Desert Falcons and points to an elaborate information-gathering exercise that was carried out before the attacks (physical and/or digital). With deception and false flags increasingly being employed by threat actors, attribution is a hard and complicated task that requires solid evidence, especially in complex regions such as the Middle East.

MUSTANG PANDA

This threat actor targets nongovernmental organizations using Mongolian-themed lures for espionage purposes. In April 2017, CrowdStrike Falcon Intelligence observed a previously unattributed actor group with a Chinese nexus targeting a U.S.-based think tank. Further analysis revealed a wider campaign with unique tactics, techniques, and procedures (TTPs). This adversary targets non-governmental organizations (NGOs) in general, but uses Mongolian language decoys and themes, suggesting this actor has a specific focus on gathering intelligence on Mongolia. These campaigns involve the use of shared malware like Poison Ivy or PlugX. Recently, Falcon Intelligence observed new activity from MUSTANG PANDA, using a unique infection chain to target likely Mongolia-based victims. This newly observed activity uses a series of redirections and fileless, malicious implementations of legitimate tools to gain access to the targeted systems. Additionally, MUSTANG PANDA actors reused previously-observed legitimate domains to host files.

The tag is: *misp-galaxy:threat-actor="MUSTANG PANDA"*

PowerPool

Malware developers have started to use the zero-day exploit for Task Scheduler component in Windows, two days after proof-of-concept code for the vulnerability appeared online.

A security researcher who uses the online name SandboxEscaper on August 27 released the source code for exploiting a security bug in the Advanced Local Procedure Call (ALPC) interface used by Windows Task Scheduler.

More specifically, the problem is with the SchRpcSetSecurity API function, which fails to properly check user's permissions, allowing write privileges on files in C:\Windows\Task.

The vulnerability affects Windows versions 7 through 10 and can be used by an attacker to escalate their privileges to all-access SYSTEM account level.

A couple of days after the exploit code became available (source and binary), malware researchers at ESET noticed its use in active malicious campaigns from a threat actor they call PowerPool, because of their tendency to use tools mostly written in PowerShell for lateral movement.

The group appears to have a small number of victims in the following countries: Chile, Germany, India, the Philippines, Poland, Russia, the United Kingdom, the United States, and Ukraine.

The researchers say that PowerPool developers did not use the binary version of the exploit,

deciding instead to make some subtle changes to the source code before recompiling it.

FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:threat-actor="FASTCash"*

Roaming Mantis

According to new research by Kaspersky's GReAT team, the online criminal activities of the Roaming Mantis Group have continued to evolve since they were first discovered in April 2018. As part of their activities, this group hacks into exploitable routers and changes their DNS configuration. This allows the attackers to redirect the router user's traffic to malicious Android apps disguised as Facebook and Chrome or to Apple phishing pages that were used to steal Apple ID credentials. Recently, Kaspersky has discovered that this group is testing a new monetization scheme by redirecting iOS users to pages that contain the Coinhive in-browser mining script rather

than the normal Apple phishing page. When users are redirected to these pages, they will be shown a blank page in the browser, but their CPU utilization will jump to 90% or higher.

The tag is: *misp-galaxy:threat-actor="Roaming Mantis"*

Roaming Mantis is also known as:

- Roaming Mantis Group

INDRIK SPIDER

INDRIK SPIDER is a sophisticated eCrime group that has been operating Dridex since June 2014. In 2015 and 2016, Dridex was one of the most prolific eCrime banking trojans on the market and, since 2014, those efforts are thought to have netted INDRIK SPIDER millions of dollars in criminal profits. Throughout its years of operation, Dridex has received multiple updates with new modules developed and new anti-analysis features added to the malware. In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately $200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: *misp-galaxy:threat-actor="INDRIK SPIDER"*

DNSpionage

Cisco Talos recently discovered a new campaign targeting Lebanon and the United Arab Emirates (UAE) affecting .gov domains, as well as a private Lebanese airline company. Based on our research, it's clear that this adversary spent time understanding the victims' network infrastructure in order to remain under the radar and act as inconspicuous as possible during their attacks. Based on this actor's infrastructure and TTPs, we haven't been able to connect them with any other campaign or actor that's been observed recently. This particular campaign utilizes two fake, malicious websites containing job postings that are used to compromise targets via malicious Microsoft Office documents with embedded macros. The malware utilized by this actor, which we are calling "DNSpionage," supports HTTP and DNS communication with the attackers. In a separate campaign, the attackers used the same IP to redirect the DNS of legitimate .gov and private company domains. During each DNS compromise, the actor carefully generated Let's Encrypt certificates for the redirected domains. These certificates provide X.509 certificates for TLS free of charge to the user. We don't know at this time if the DNS redirections were successful. In this post, we will break down the attackers' methods and show how they used malicious documents to attempt to trick users into opening malicious websites that are disguised as "help wanted" sites for job seekers. Additionally, we will describe the malicious DNS redirection and the timeline of the events.

The tag is: *misp-galaxy:threat-actor="DNSpionage"*

DNSpionage is also known as:

DarkVishnya

Dubbed DarkVishnya, the attacks targeted at least eight banks using readily-available gear such as netbooks or inexpensive laptops, Raspberry Pi mini-computers, or a Bash Bunny - a USB-sized piece hardware for penetration testing purposes that can pose as a keyboard, flash storage, network

adapter, or as any serial device.

Operation Poison Needles

What's noteworthy is that according to the introduction on the compromised website of the polyclinic (http://www.p2f.ru), the institution was established in 1965 and it was founded by the Presidential Administration of Russia. The multidisciplinary outpatient institution mainly serves the civil servants of the highest executive, legislative, judicial authorities of the Russian Federation, as well as famous figures of science and art. Since it is the first detection of this APT attack by 360 Security on a global scale, we code-named it as "Operation Poison Needles", considering that the target was a medical institution. Currently, the attribution of the attacker is still under investigation. However, the special background of the polyclinic and the sensitiveness of the group it served both indicate the attack is highly targeted. Simultaneously, the attack occurred at a very sensitive timing of the Kerch Strait Incident, so it also aroused the assumption on the political attribution of the attack.

Operation Sharpshooter

The McAfee Advanced Threat Research team and McAfee Labs Malware Operations Group have discovered a new global campaign targeting nuclear, defense, energy, and financial companies, based on McAfee® Global Threat Intelligence. This campaign, Operation Sharpshooter, leverages an in-memory implant to download and retrieve a second-stage implant—which we call Rising Sun—for further exploitation. According to our analysis, the Rising Sun implant uses source code from the Lazarus Group’s 2015 backdoor Trojan Duuzer in a new framework to infiltrate these key industries. Operation Sharpshooter’s numerous technical links to the Lazarus Group seem too obvious to immediately draw the conclusion that they are responsible for the attacks, and instead indicate a potential for false flags. Our research focuses on how this actor operates, the global impact, and how to detect the attack. We shall leave attribution to the broader security community.

TA505

TA505, the name given by Proofpoint, has been in the cybercrime business for at least four years. This is the group behind the infamous Dridex banking trojan and Locky ransomware, delivered through malicious email campaigns via Necurs botnet. Other malware associated with TA505 include Philadelphia and GlobeImposter ransomware families.

GRIM SPIDER

GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since

August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past. Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk’s appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of $3,701,893.98 USD. Grim Spider is reportedly associated with Lunar Spider and Wizard Spider.

The tag is: *misp-galaxy:threat-actor="GRIM SPIDER"*

GRIM SPIDER is also known as:

- GOLD ULRICK

WIZARD SPIDER

Wizard Spider is reportedly associated with Grim Spider and Lunar Spider. The WIZARD SPIDER threat group is the Russia-based operator of the TrickBot banking malware. This group represents a growing criminal enterprise of which GRIM SPIDER appears to be a subset. The LUNAR SPIDER threat group is the Eastern European-based operator and developer of the commodity banking malware called BokBot (aka IcedID), which was first observed in April 2017. The BokBot malware provides LUNAR SPIDER affiliates with a variety of capabilities to enable credential theft and wire fraud, through the use of webinjects and a malware distribution function. GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past.

MUMMY SPIDER

MUMMY SPIDER is a criminal entity linked to the core development of the malware most commonly known as Emotet or Geodo. First observed in mid-2014, this malware shared code with the Bugat (aka Feodo) banking Trojan. However, MUMMY SPIDER swiftly developed the malware's capabilities to include an RSA key exchange for command and control (C2) communication and a modular architecture. MUMMY SPIDER does not follow typical criminal behavioral patterns. In particular, MUMMY SPIDER usually conducts attacks for a few months before ceasing operations for a period of between three and 12 months, before returning with a new variant or version. After a 10 month hiatus, MUMMY SPIDER returned Emotet to operation in December 2016 but the latest variant is not deploying a banking Trojan module with web injects, it is currently acting as a 'loader' delivering other malware packages. The primary modules perform reconnaissance on victim machines, drop freeware tools for credential collection from web browsers and mail clients and a spam plugin for self-propagation. The malware is also issuing commands to download and execute other malware families such as the banking Trojans Dridex and Qakbot. MUMMY SPIDER advertised Emotet on underground forums until 2015, at which time it became private. Therefore, it is highly likely that Emotet is operate
