PREFACE

About twenty years have passed since the Amorite computer project was begun. This long period of gestation reflects in some measure the many problems we have faced in all stages of our work: continuous correction of punch cards prepared by inexperienced keypunchers; changes in the analysis of individual names, which had to be entered on white cards, pink cards, punch cards, and in material being prepared for the forthcoming grammar (see below); changes in the new and improved computer programs, which required innumerable test runs; and, finally, the addition over the years of new material, some of which simply complemented the old material, while some forced important changes in the analysis of the data.

My original plan was to publish two volumes on Amorite, one containing the computer-aided analysis of the language and the other the grammar, glossary, and general discussion. I have decided to publish the computer-aided analysis immediately, in case another avalanche of new material should appear while the second volume is being prepared for publication, forcing another long delay in the project.

When completed, the second, much smaller volume will contain a grammar (hereinafter referred to as *Grammar*) in which the data culled from the computer analysis will be reinterpreted and put in the traditional order, in more or less the same form as in my article "Lingua" (see "Abbreviations of Sources"). Unlike the computer analysis, in which all of the data are presented, both the firmly established and the questionable, *Grammar* will deal mainly with ascertainable data. The glossary will consist of a list of free morphemes that occur in Amorite names and will provide translations and annotations whenever possible or necessary. This glossary will also include all the glosses known from the Old Babylonian Mari texts and from other sources. Inasmuch as the present volume may be difficult to use without some immediate help in matters of semantics and morphology, a small preliminary glossary is provided below (under 0.7) to serve as a guide to the computer analysis. This glossary, with its limited critical apparatus, is not intended to stand in place of the full glossary, which will be published in *Grammar*.

The second volume will also contain a brief history of the Amorites, an evaluation of the comparative aspects of the Amorite language, and other general discussion. Since much of the second volume has already been written, there is hope that the entire project may soon be brought to a successful completion.

The title of the present book, *Computer-aided Analysis of Amorite*, does not fully reflect the vast amount of personal, manual work that had to be done at all stages preparatory to the use of the computer. All of the analysis, of course, was done not by the machine but by human effort, and all the good and bad features are ultimately attributable to man. The computer makes no mistakes of its own accord—it merely follows the instructions given by the person in charge. It does, however, add something that no one person could accomplish in a whole lifetime, and that is the vast volume of quantitative documentation.

It must be stressed here, as will be done repeatedly later, that *Computer-aided Analysis of Amorite* is not and cannot be considered to be a grammar of the Amorite language. Rather, it presents a large body of source material, ordered in categories that can be utilized in the study of the non-Akkadian language that we conventionally call Amorite.

The reason why this study cannot be considered a grammar of the Amorite language is obvious. The computer analysis contains a disparate body of material, bringing together not only interpretations which are safe but also others which, owing to the character of the cuneiform writing and human fallibility, must be considered provisional. For example, it places under one heading a meaningful category such as the bound morpheme AH, which stands for the feminine noun. On the other hand, under the bound morpheme A it records a variety of categories which can stand for any morpheme ending in *-a*, be it masculine noun, stative, verb, pronoun, or whatever. Moreover, the computer analysis orders the categories in alphabetical sequence by form (or by rank and form in the case of prefixes and suffixes), rather than by the categories customary in a traditional grammatical analysis. Even the word "Amorite" in the title of this book may be open to question, as the data include not only names identified as Amorite by an ethnic designation or by their context, but also all clearly Semitic but non-Akkadian names of the Old Babylonian period. This problem is discussed further in section 0.1, "Amorite Names."

Despite its weaknesses, the computer analysis makes both a quantitative and a qualitative contribution which in some respects can be considered unique in the field of Semitic linguistics.

Chapter 6, "Index of Names," contains 6,662 entries, including variant forms. As it would have been unduly time-consuming to go through the whole list to ascertain the number of distinct Amorite names, eliminating all variants, I have estimated the number of different names on the basis of a random count of thirty pages. The total obtained by this method was 5,922 different names, a number substantially larger than that found in any of the six published lists of Mesopotamian names.[1] Of the two

1. Knut L. Tallqvist, *Assyrian Personal Names*, Acta Societatis Scientiarum Fennicae, vol. 43, no. 1 (Helsinki, 1914), with about 5,400 entries, comes closest.

oi.uchicago.edu

large collections of Amorite names published in the past, that by Theo Bauer lists 958 names altogether, including variants, or 786 names excluding variants,[2] while that by H. B. Huffmon lists 1,157 Mari names altogether, including variants, or 879 names excluding variants.[3]

From the quantitative point of view the lists of bound morphemes presented in chapter 3, "Prefixes and Suffixes," outnumber any found in the grammars of Semitic languages. To cite just one example, the computer analysis lists hundreds of examples of the three allomorphs of the feminine singular noun (-AT-, -T-, and -AH), while the most complete Semitic grammars have a few dozen at the most. The complete listing of all the stems (or formations) and the statistical data of the stem and consonant frequencies given in chapter 4, "Stem Count," and in chapter 5, "Phoneme Count," have no parallels in the Semitic field. These two chapters were produced with very little human effort, once the program had been prepared. All the work was done expeditiously by the computer.

From the qualitative point of view it is possible that the grammar of Amorite, reconstructed almost entirely from names, may become better known than that of several Semitic languages attested in thousands of inscriptions, for example, Nabatean, Palmyrenian, or South Arabic. The reason may be not so much the amount of documentation as the structural richness of Amorite names (as opposed to the linguisitic poverty of the preserved inscriptions of some Semitic languages). As an example we may cite the personal pronoun and the verb, attested in the first, second, and third persons singular in Amorite, but only in the third person in the other three languages (the only exception known to me being KTBT for the first person in Palmyrenian).

Included in this volume are names from all Amorite sources available to me up to June 1976.

Statistical evaluations of lists of Semitic names are given in Ignace J. Gelb, Pierre M. Purves, and Allan A. MacRae, *Nuzi Personal Names*, OIP 57 (Chicago, 1943), p. 5 and in Martin Noth, *Die israelitischen Personennamen im Rahmen der gemeinsemitischen Namengebung* (Stuttgart, 1928), p. 87.

2. *Die Ostkanaanäer: Eine philologisch-historische Untersuchung über die Wanderschicht der sogenannten "Amoriter" in Babylonien* (Leipzig, 1926), pp. 9-49 and 92-93.

3. *Amorite Personal Names in the Mari Texts: A Structural and Lexical Study* (Baltimore, 1965), pp. 19-60.

I wish to express here my heartfelt gratitude to the many persons and institutions who have helped in the course of about twenty years to bring the Amorite project to fruition. The specific contributions of most of them are described in section 0.2, "History of the Computer Project," and section 0.6, "Computer Report."

Professor Stanislav Segert of Prague, now at the University of California in Los Angeles, was constructively involved in the original planning of the Amorite project. Professor Burkhart Kienast of Freiburg, Germany, generously allowed me to use the manuscript of the index of names to his Kisurra publication, which was published recently.[4] Professor David I. Owen of Cornell University provided me with Ur III texts, and Père Marcel Sigrist of the Ecole Biblique Française in Jerusalem with Old Babylonian texts, from which a few scattered references were excerpted.

Financial assistance for the project was provided by the Division of Humanities at the University of Chicago through the kind offices of Professor Robert E. Streeter and Professor Karl J. Weintraub; by the Department of Linguistics with the help of Professor George V. Bobrinskoy and Professor Eric P. Hamp; and by the Oriental Institute with the help of Professor John A. Brinkman, its director. The receipt of a substantial sum of money in 1969-70 from the American Council of Learned Societies is also gratefully acknowledged.

Help with computer programing was given by Professor Victor Yngve and by Messrs. Stephen P. Soulé and Clive A. Church, all of the University of Chicago. Messrs. Allan B. Addleman and Fred H. Harris of the University's Computation Center assisted substantially in technical matters.

The overall contributions of Miss Joyce Bartels and Messrs. Stuart-Morgan Vance and Robert M. Whiting are described in section 0.2, "History of the Computer Project." In acknowledgment of their important contributions their names are listed on the title page.

POSTSCRIPT OF DECEMBER 1979

As noted above, June 1976 marked the last date at which material from recently published sources could be included in this volume. Since that date, however, a number of publications have appeared, some of which contain important additions to the corpus. The following list contains a few new entries excerpted from scattered publications and also some corrections of the transliteration and analysis offered in this volume. The entries below are numbered in accordance with the corresponding entries in chapter 6, "Index of Names."

Add 66a ʾAB-I+DAŠUR A-BI-DA-ŠU-UR MESOPOTAMIA X-XI P. 27:19

Add 295a ʾAJA+ᶜAMM-U-HU [A]-IA-ḪA-AM-MU-U_2 TIM II 96:3

Add 476a ḪANAN-UM+ʾIL A-NA-NU-UM-DINGIR FLP 1761, UR III

Add another reference to 426: UET IX 128:1, 6, UR III

Probably correct 693 JA-ᶜḎAR+ᶜIL AḪ-ZA-AR-I_3-DINGIR to JA-ᶜḎAR+ʾIL A-AḪ-ZA-AR-I_3-DINGIR (Robert M. Whiting)

Correct 1520 ʾIL-I+ʾA-PTAN to ʾIL-A+ʾA-PTAN

Correct 1525 ʾIL-I+DAᶜ-AT to ʾIL-A+DAᶜ-AT

Correct 1549 ʾIL-I+MAʾD-I+ʾAḪ to ʾIL-A+MAʾD-I+ʾAḪ

Add 1751a QARAʾ+ʾIL GA-RA-DINGIR UET IX 128, UR III

Add 2106a ḪAʾL-U+ŠAMUᶜ ḪA-LU-SA-MU-UḪ SYRIA L 279:12

Correct 2237 ḪAN-NA-D-EN-ZU to ḪA-AN-NA-D-EN-ZU

Add 2506a JI-KWUN+ʾEL I-KU-EL TA 1931, 141

Change the present analysis of BAʾB in 2733 ʾIL-I-Š+BAʾB-A to ʾIL-I-Š-BAWB-A

Add 2752a ʾIL-I+ME+JATAR I_3-LI_2-ME-A-TAR MESOPOTAMIA X-XI P. 10:5

Add 4728a LA+KIWN+PU-HU LA-KI-IN-PU-U_2 YOS XIII 459:8

Add 4373a LI+JI-TWUR+ʾAŠD-UM LI-TU-UR-AŠ-DU-UM JCS XXIX P. 147:14 AND SEAL

Add 4650a ME-KWIN-UM ME-KIN_2-NU-UM TIM V 23:2,9, AND SEAL

Add 4699a MILK-UM MI-IL-KU-UM TA 1931, 141

Add another reference to 4846: SYRIA L 279:3

Add 5077a NUN-U+RIMŠ-I D-NU-NU-RI-IM-SI? FEM SYRIA LII PL. IV

Delete 5585, since this entry is identical with 5680 (Robert M. Whiting)

Change the present analysis of BAʾB in 5908 ŠU+BAʾB-A to ŠU+BAWB-A

Correct 6639 ZUḪL-AN-UM ZU-U$Ḫ_3$-LA-NU-U[M] to .... U_3-ZU-U$Ḫ_3$-LA-NU-UM in accordance with a new join (Robert M. Whiting)

This list contains no citations from any of the larger publications listed below—specifically, those under Roualt, Limet, and Dalley et al.—or, of course, from any of the Ibla sources.

0. INTRODUCTION

0.1. Amorite Names

Our knowledge of Amorite is based almost exclusively on the analysis of proper names. The majority are personal names, but there is also a scattering of geographical names and of names of divinities.

The names are found in cuneiform texts written in the Akkadian (Assyro-Babylonian) language. In content, the texts are mainly letters or administrative and legal documents. The texts may refer to individuals by name or may list them in groups ranging from only a few persons to several hundred. The longest such list, which names 833 individuals, is a Mari administrative text published by G. Dossin[1] and indexed by J.-M. Aynard.[2]

Since 1926, when Bauer's first extended treatment of the Amorite language appeared,[3] the available sources have increased enormously. More important, most of the new sources have come not from Babylonia, the area on which Bauer's study was based, but from sites in the areas where the Amorites lived, such as Mari, Chagar Bazar, and Alalakh (level IX). As expected, these new sources cite Amorite names in a form closer to the original and represent them more consistently than do the Babylonian sources, in which the names are often garbled due to ignorance of the Amorite language on the part of the scribes living in a non-Amorite milieu. Thus the non-Babylonian materials offer a new and more reliable basis for a thorough phonological and morphological analysis.

My interest in Amorite is an outgrowth of the Seminar in Proto-West Semitic, which I held in the spring of 1956 at the University of Chicago. In 1957-58 I prepared a large work on the grammar and lexicon of the Amorite language, a brief digest of which was published as "La lingua degli Amoriti."[4]

In order to achieve a more or less synchronic reconstruction of the language, my work from the beginning was centered on the Old Babylonian period, for which by far the largest number of Amorite names is documented. Names from the few earlier sources, mainly Sumerian administrative texts of the Ur III period, were collected to demonstrate the linguistic unity of the Ur III and Old Babylonian names. Some occurrences from post-Old Babylonian sources, such as Alalakh IV, Ugarit, and Qatna, were adduced, but only in cases where a point weakly documented in the Old Babylonian period needed bolstering from additional evidence.

Before the terms "East Canaanite" or "Canaanite" entered the field with the publication of Bauer's *Ostkanaanäer*, Assyriologists generally applied the term "Amorite" to these Old Babylonian names. Recent studies on this subject employ only the term Amorite.[5]

The Old Babylonian names that we call Amorite generally appear in the Akkadian texts without any ethnolinguistic designation to link them with either the country Amurru or with the Amorite people or language. In the past it was assumed that these names should be called Amorite mainly because they began to appear in mass in Babylonia after, and in consequence of, the Amorite invasions and conquests that took place at the end of the Ur III dynasty and the beginning of the Old Babylonian period.

In contrast to the names of the Old Babylonian period, the Ur III names regularly bear the designation MAR.TU "Amorite." The Old Babylonian names that bear no ethnolinguistic designation are practically identical with the Ur III names. This, as I had noted in 1961,[6] has been demonstrated convincingly by Buccellati.[7]

In addition to the Ur III sources, texts of the early Old Babylonian (Isin-Larsa) period also regularly list names with the MAR.TU "Amorite" designation. These are the several dozen names from Isin, published mainly in BIN IX and collected and analyzed by Buccellati,[8] and many more found in unpublished texts from Tell Asmar (ancient Eshnunna), which Robert Whiting has been studying for the past few years. Perhaps the most important of the latter is the text TA 1930, 615.[9]

Authors of recent studies on the Amorites have stressed the fact that the major Amorite areas lay west of Babylonia, namely, in Upper Mesopotamia (Mari and Chagar Bazar) and Syria (Alalakh).[10] The evidence connecting the Amorites with the areas east and south of Babylonia is discussed by Buccellati.[11] While he called such evidence "quite elusive," he did point out the connection between Dilmun (modern Bahrein) and the Amorites (*Dilmun*^{KI} *ù*

oi.uchicago.edu

MAR.TU-*ne* in BIN IX 405), a connection which now appears to receive support from a text recently excavated by a Danish expedition at the site of Qalᶜat in Bahrein. The tablet became known to me from a rough copy brought from Denmark by Juris Zarins, a former student of mine. The text, which I would like to date to the post-Ur III or the Isin-Larsa period, is a simple list of three persons, the third being the son of the first. It reads:

1) 1 *Ia-a-bi-na-im* /*Janbiᵓ-naᶜim*/
2) 1 DINGIR-*mi-il-kum* /*ᵓIla-milkum*/
Rev. 3) 1 *I-zi-ta-am-bu* /*Jīṣiᵓ-tambu*/
4) DUMU *I-a-bi-na-im* /*Janbiᵓ-naᶜim*/

All we can say for certain about these three Bahrein names is that they are all clearly Amorite in the sense that we understand and use the term, thus confirming the connection between Dilmun and Amorites deduced from BIN IX 405, cited above. The extension of the Amorites eastward toward the Persian Gulf is also suggested by a passage in the text TA 1930, 615,[12] which notes the derivation of one or more Amorites *a-ab-ba-ta*, "from the Sea," that is, from the Sea-Land or from the land across the Sea, which can be only the Persian Gulf.

To summarize briefly, we find that the geographical distribution of names that are here called Amorite extends from Upper Mesopotamia and Syria in the west, through Babylonia (including the Diyala District) in the center, to areas east of Babylonia as far as Bahrein.

The materials collected from these areas in this volume include all clearly Semitic but non-Akkadian names. Such names may bear an ethnic designation; much more frequently they do not. When they do bear such a designation, it may be Amorite or it may be that of the Ḫanians, Sutians, or some other people, whose relation to the Amorites is as yet unclear. The names listed here may include some which could possibly be Akkadian but which may be justifiably treated as Amorite because they happen to occur in a list of other good West Semitic names, or by virtue of stated family relationships. In doubtful cases, the tendency was to include rather than to disregard.

Considering the very wide area (extending from Syria to Bahrein) from which names have been collected, it is quite possible, nay probable, that the names encompassed in this volume represent more than the one ethnolinguistic unit, the Amorites. On that score, the warning of von Soden against the notion of a monolithic Amorite appears fully justified.[13] In fact, the recent discovery of the Ibla texts in Syria leads one to pause for thought, as it furnishes evidence that the area included a greater linguistic variety than had hitherto been supposed. I hope to discuss these linguistic and dialectal problems in a future article.

0.2. History of the Computer Project

The early summer of 1976 marked the end of several stages in the history of the Amorite Computer Project, which began to germinate in 1960 and 1963 when I had the occasion, during visits to Prague, to discuss my plans for preparing the Amorite work for publication with Stanislav Segert, then a research fellow in Semitic philology at the Oriental Institute of the Czechoslovak Academy. Because of his own involvement in the preparation of a comparative dictionary of the West Semitic languages, Segert, from the start, showed great interest in my lexical work on Amorite as a part of his overall project. Since the work on his comparative dictionary was based on the use of a computer, he persuaded me to use a computer in the Amorite project. As a result, we began to take steps to enable Segert to come to Chicago for a prolonged stay so that he and I could coordinate our planning. Segert came to Chicago in December 1965 and stayed for about six months. We divided our work in accordance with our interests. I concentrated on the Amorite language, while Segert worked on materials from the South Arabic area. Using the same IBM 7090 computer and a similar program, Segert accepted my code for the Semitic phonemes, with some small changes.

After Segert's return to Prague, I continued my work until early 1967. Professor Victor Yngve and his student Stephen P. Soulé were in charge of the computer programming, and Miss Joyce Bartels supervised the execution of the project.

The procedure followed in collecting and integrating the Amorite materials consisted of three steps. First, all names were transliterated on 3- by 5-inch white cards. Next, the names were copied on pink cards and the analysis was added. And, finally, punch cards were prepared from the pink cards. I will outline briefly the way each of these steps was carried out and will give the reasons for some of the decisions made along the way. A detailed description of the computer processing, written by Vance and Whiting, appears in section 0.6, "Computer Report."

All the names that I considered to be either unquestionably or possibly Amorite were collected in standard Assyriological transliteration on white cards in the following form:

Áš-du-um-la-a-bu-um Sumer V 142

Each card contained a single source reference. In addition, many cards contained notes about place of origin, date of source, and family relations of the person bearing the name, as well as discussion of tentative interpretation(s), questionable points of transliteration, and the like. These cards were filed under the first element of the name (in the above case *ᵓaśdum*), with cross references to other elements (in the above case *la* and *ᵓabum*). The entries were filed in the roman order as applied to the Semitic root consonants.

The next step was to rewrite the white cards on pink cards, combining all occurrences of the same name on one pink card and adding the analysis in the following form:

Áš-du-um-la-a-bu-um ᵓAśd-um+la+ᵓab-um Sumer V 142+

oi.uchicago.edu

As will be explained in detail in section 0.3, the dash was used to separate graphemic elements in the transliteration, and of bound morphemes in the analysis section; the plus mark was used to separate the different elements of a name in the analysis section and to indicate the existence of additional occurrences in the references section. For some names a helpful abbreviation, symbol, or other information was added to the analysis and reference, such as "FN" for feminine name, "QATNA" for the geographical origin. The pink cards were alphabetized in the same order as the white cards. All the work on the white and pink cards was done by myself exclusively.

The information from the pink cards was next transferred by keypunchers to standard-size computer punch cards, with the order reversed from transliteration-analysis to analysis-transliteration. The 80 spaces available on the punch card were divided in the following way: spaces 1-24 were reserved for the analysis, spaces 25-54 for an asterisk followed by the transliteration, and spaces 55-80 for a period followed by the reference(s). Occasionally, when the transliteration extended beyond the space allotted to it, the part containing the reference(s) was moved to the right by a corresponding number of spaces.

The result of the 1966-67 work was a computer list of about 4,000 names, given in more or less the same form, although not in the same order, as in chapter 6, "Index of Names."

After a brief interval, my work on the Amorite project was resumed in March 1969 and continued throughout 1970. Stuart-Morgan Vance, at that time a student in linguistics, replaced Soulé as the programer, and Robert Whiting, then a student in Assyriology, replaced Miss Bartels as the supervisor of the project. During this stage the list of names was increased to almost 5,000 and the chapters pertaining to stems, roots, prefixes and suffixes, and what was then called "root vocalism" were completed.

Quantitatively, the output may have looked impressive, but it had two shortcomings. First, the list was printed with diacritics placed beside the letters rather than below them, which made it difficult for users unaccustomed to this notation to read it. Second, there were a number of bugs that made extensive corrections necessary. Only a person working with computers is aware of the incredible amount of time that some very simple corrections require. In this study, for instance, a misplaced dot may play havoc with the ordering of entries in at least four to as many as twelve different places, depending on the number of bound and free morphemes in a name. Making the corrections required by such a misplacement of a dot involved not only changing diacritics but also cutting out whole lines and transferring them to the right places.

As it turned out, the correction of these undesirable features in the 1970 material had to be delayed from month to month because of other commitments, and the longer the delay, the more new material accumulated that had to be added. The final setback was when the University of Chicago decided in 1972 to replace the old IBM 7090 with a new, greatly improved IBM 360/65. As a result, our programs, written in Comit II for the earlier computer, had to be adapted to the new computer, a procedure that involved much effort and experimentation. The four-year delay came to an end in October 1974 with the decision to revise and complete the work. The changeover to the new computer was successfully achieved with the help of Professor Yngve, the author of Comit II, and of Miss Eleanor Lewis. Vance and Whiting, both by then Ph.D.'s, continued to carry out their earlier responsibilities.

The work, completed in January of 1975, contained about 6,500 names and approximated in size and content the edition of 1970. Only the chapter that contained the list of names, produced according to the earlier computer program, was left in the old typography. All other chapters have been adapted to the new typography with the help of Mr. Clive Church of the Computation Center. Alas, having eliminated the old bugs, a number of quite disturbing new ones had crept into the program. Among them, one alone —the accidental omission of the suffix NI in the typography program—necessitated some 100 corrections.

The present volume is the result of work done in May-June of 1976, in which Vance and Whiting supervised their respective spheres of competence. In the meantime, Whiting had acquired enough expertise in computer matters to enable him to contribute substantially to the programing of certain sections.

The form and content of the final work underwent a number of important changes. Only the first three chapters —on stems, roots, and prefixes and suffixes—retained their earlier form. The old chapter on root vocalism, equal in form and size to each of the chapters on stems and roots, was completely revised to conform with the new chapter on phoneme count, and was renamed "Stem Count." Whiting and Vance expanded the new chapter on phoneme count, started as an exercise by Peter T. Daniels in my seminar in winter 1975, and made it compatible with the overall presentation.

The old list of names was increased to 6,662 entries by the addition of over 100 names punched with the help of Mr. Peter Steinkeller. More important, the list was accommodated to the new typography program and reordered by Whiting in the strict alphabetical sequence of the transliterations. The bugs of the earlier version were eliminated completely by the new program, and the very few bugs that had crept into the present version have been corrected manually.

0.3. Structure of the Volume

The first six chapters in the volume can be treated in three parts:

Part 1, containing the first three chapters, "Stems," "Roots," and "Prefixes and Suffixes," lists all the names in the same form, but groups them under different topical headings, here called "lemmata." Chapter 1, "Stems," is basic. Chapter 2, "Roots," is derived from chapter 1 by the elimination of stem vowels. Chapter 3, "Prefixes and Suffixes," lists all the bound morphemes shown in the analysis column of chapters 1 and 2.

oi.uchicago.edu

Part 2, containing chapters 4 and 5, "Stem Count," and "Phoneme Count," synthesizes the results extrapolated from the lemmata of chapters 1 and 2.

Part 3, containing chapter 6, "Index of Names," gives a complete list of the transliterated names in the order of the roman alphabet. Attached to it is a small chapter 7, "Unanalyzed Names," excerpted from the previous chapter.

Before proceeding with the discussion of the structure of the first three chapters, we must explain certain formal differences between the computer output as it appears in chapters 1-7 and the general discussions in the introductory parts of this volume.

As noted below, computer limitations and certain unilateral decisions made by the author to facilitate the use of the materials in a future study forced a certain artificial format in the computer output. In my discussions this format has been changed to conform with the reality and with standard Assyriological or Semitic usage. The forms cited in the discussions in this volume are the same as those in section 0.7, "Glossary," and as they will appear in the *Grammar*.

The most important of these formal changes affects the use of capital letters and of the symbols - and +, as in the following example, in which the first line gives the form as it appears in the computer output, the second as it appears in discussions:

ŚMA^{c} 1 JA ŚMA^{c} HADD U IA-AŠ$_2$-MA-AḪ-D-IM M+, C+

śma^{ɔ} 1 *Ja-śma*^{c}*+Hadd-u* *Ja-áš-ma-aḫ-*^{d}IM M+, C+

The computer output gives the form in capital letters exclusively, while the discussions give it in capitals and lowercase letters. In the initial stages of the project, the exclusive use of capitals was governed by the ease in computer programing. Subsequently, the capitals were retained for reasons of legibility, when we discovered, after some experimentation, that capital letters with attached diacritics are easier to read than small letters with attached diacritics. This is especially true in the present volume, with its printout pages greatly reduced in the printing.

The omission of the symbols - and + in the analysis column of the computer output was necessitated by the computer programing.

In the discussions, capital and lowercase letters are differentiated throughout, and the symbols - and + are restored.

Several other differences between the form in the computer output and that in the discussions, which will be treated more fully on the following pages, are the following:

1) in analysis (see pp. 4, 6, below), the fourth element of a name has been restored
2) in analysis (p. 6), the question mark (?) and full brackets ([ ]) have been restored, as also the half brackets (⌜ ⌝) in transliteration (p. 8)
3) in analysis (p. 6), morpheme doubling, as expressed by double consonants (consonantal quantity) and long vowels (vocalic quantity), has been restored
4) in analysis (p. 6), certain prefixes and suffixes, which were run together in the computer output because of space limitations, have been correctly separated by a hyphen
5) in analysis (p. 6), certain types of stems have been reinterpreted
6) in transliteration (pp. 7-8), the form of the determinatives or semantic indicators and of the numbers and diacritics attached to the signs has been changed to conform to standard notation

The first three chapters (chapter 1, "Stems," chapter 2, "Roots," and chapter 3, "Prefixes and Suffixes") constitute the most important and the largest part of the volume. These three chapters can and will be treated here together.

In these three chapters each entry is given in four columns, symbolized here as lemma, analysis, transliteration, and references. Each of the four columns occupies a set number of the 132 spaces that are available on the computer printer (enlarged from the 80 spaces of the punch card). The spaces were allotted in the following way: 11 spaces to the lemma, including the number to indicate whether the lemma is located in the first, second, or third element of the name; 56 spaces to the analysis, with several suballotments; 30 spaces to the transliteration, including some descriptive indications; and 35 spaces to the references, including some descriptive indications.

The use of these space allotments and suballotments is illustrated below by five examples in table 1.

In the computer output, all of the above examples are given in capital letters alone. In the discussion that follows, the examples are given in capitals and lowercase letters, according to standard Assyriological practice. Also incorporated are the other formal changes discussed briefly above, which will be taken up in detail below.

A name may be composed of one, two, three, or as many as four elements.

1. *Lemma.* The first column is occupied by a lemma plus a number. The lemma gives a stem or prefix/suffix in exactly the form that is shown in the second, analysis column. The root is derived from the stem by the omission of all vowels. The number that follows the lemma shows whether the lemma occurs in the first, second, or third element of the name. (Number 4 does not occur after the lemma because the fourth element in the few names that have four elements was not analyzed in the analysis column. See below.) A particular number refers not only to the line in which it occurs but also to all successive lines that contain the same lemma in the same position.

2. *Analysis.* The second column is occupied by the analysis of the name, given in one to three parts: a one-element name appears in the first part of the analysis space; the two elements of a two-element name appear side by side in the first and second parts of the analysis space; in the case of a three-element name, the first two elements appear side by side in the first and second parts of the space, and the third element appears just below the second. The fourth

oi.uchicago.edu

element in the four-element names has not been analyzed due to limitations connected with computer programing.

The number of names with four elements (all transliterated in full in the transliteration column) is very small —only four in all:

/ʾAb-ī+mi+ki(+ʾIl)/
A-bi-mi-ki-DINGIR
/ Lāšū+ʾEl+ka(+ʾab-im)/
La-ši-El-ka-a-bi-im
/ Śamś-u+ʾil-u-na+kima(+ʾIl)/
Sa-am-su-i-lu-na-ki-ma-DINGIR
/ Śum-u+li+ʾEl(+dūr-ī)/
Su-mu-li-El-du-ri

Only the first two names are actually composed of four clearly Amorite elements: */ʾAbī-mi-ki-ʾIl/* "My-father-is-truly-like-ʾIl" and */ Lāšū-ʾEl-ka-ʾabim/* "There-is-no-ʾEl-like-father." The third and fourth names are composed of the Amorite royal names */ Śamśu-ʾiluna/* and */ Śumu-li-ʾEl/* to which are added the elements *kima*, *ʾIl* (or *ʾilim*), and *dūrī*, which may be either Amorite or Akkadian.

Each element of a name consists of a stem, with or without prefixes or suffixes. In the present analysis there are two ranks of prefixes and three ranks of suffixes.

The analysis is the most important and at the same time the most controversial part of this volume. It is the most important because it yields the computer analysis of morphemes on which the whole volume is based. It is also the most controversial due to computer-program limitations and to unilateral decisions made by the author to facilitate the collection of material under some meaningful or workable headings.

No question marks for doubtful readings or interpretations and no brackets for destroyed portions of names are given in the analysis column, although both are shown in the transliteration column that follows.

Nor is the morpheme doubling, as expressed by double consonants (consonantal quantity) or long vowels (vocalic quantity), shown in the analysis column. In contrast, root double consonants are always indicated. Thus the analysis column gives only NATIN, which may stand for *natin*, *nattin*, *nātin*, or *natīn*, but it also gives HADD, which correctly represents the three root consonants H, D, and D.

The decision to omit question marks, brackets, and morphemic doubling in analysis was made only after long experimentation. We decided to omit question marks because we could find no way to distinguish between questionable readings and questionable interpretations. At the same time, we decided not to indicate morpheme doubling in order to avoid the many doubtful interpretations that might have arisen as a result of the imperfect state of our knowledge of Amorite grammar and the vagaries of the Old Babylonian writing, which frequently leaves double consonants and long vowels unexpressed. Moreover, the indication of the morpheme doubling would have played havoc with the root and stem analysis, while the use of symbols for the question mark and brackets would have interfered with the computer analysis, which is based solely on consonants and vowels.

Because of space limitations, certain prefixes and suffixes had to be run together. Thus ATANUM really stands for ATAN UM and ANIJI for ANIJ I. One can deduce the correct segmentation from the columns. For the same reason, the rare single-rank prefix ŠT was introduced, in place of what should properly have been two separate prefixes, Š and T.

It has proved impossible to mark in any way two or more variant forms of the same name, especially in cases which, on the surface, might be perceived as unrelated. Thus the name spelled *Da*-WI-*da-nim*, which theoretically could be read as *Da-wi-da-nim*, was read as *Da-aw-da-nim* because of the variant form *Da-am-da?-nim* for the name of the same person (in all cases, the father of */ Etel-pī-Sin/*. The variant forms *La-ú-um* and *Li-ú-um*, *Ia-di-a-bu-um* and *Ia-du-a-bu-um*, and *Ma-ah-nu*-KA and *Ma-ah-nu-up-ì-lí* were treated in a similar fashion. All such cases will be fully annotated in *Grammar*.

In order to facilitate the computer analysis, certain radical decisions have been made in the analysis of free and bound morphemes. Often the new analysis has no reality in the grammar of the Semitic languages. This is especially true of the analysis of stems and roots with the so-called weak consonants, as well as of some prefixes and suffixes. Thus the analysis here followed has the verbal stems *nwuḫ* in */Ja-nwuḫ-/* for */Janūḫ-/* or *nwiḫ* in */Ja-nwiḫ-/* for */Janīḫ-/*, and the nominal stems *nawḫ-* in */Nawḫ-ān-um/* for */Nāḫānum/*, *niwḫ-* in */Niwḫ-at-um/* for */Nīḫatum/*, and *nuwḫ-* in */Nuwḫ-um/* for */Nūḫum/*, bringing all of them together under the artificial consonantal root NWḪ for *nāḫ*, *nīḫ*, and *nūḫ*. The same kind of analysis resulted in *ḥnun* in */Ja-ḥnun-/* (to bring it into accordance with the standard *qtul* stem), in place of *ḥun* (or *ḥunn*), which occurs in the name spelled *Ia-ḫu-un*-DINGIR */Jaḥun-ʾIl/*.

Similar analysis has been applied to a number of prefixes and suffixes. Thus we have used the prefix N for the N-stem, even though it is realized as NA, NI, NU, or N. The prefix T, used for the T-stem, is always ranked before the stem, as in */Ja-t-baḥar-na/* and */T-baḥr-um/*, even though it appears regularly after the first radical consonant in */Jabtaḥarna/* and */Bataḥrum/*. The suffix AH is used for the feminine noun, with an artificial H introduced to differentiate this suffix from that of other bound morphemes ending in *-a* and symbolized here as A; the two symbolizations, AH and A, represent two types of commitment: a full commitment under AH, which always stands for the feminine noun, and a zero commitment under A, which can stand for any morpheme ending in *-a*, as in the nouns */Maśīḥa/* "Anointed," */Jadīda/* "Beloved" (masc.) besides */Jadīdah/* (fem.) or */Jadīdatum/* (fem.), and */ʾAdattah/* "Lady"; the names of the divinities */Hadda/* and */ʾIrra/*; the stative *ṭāba* in */ʾAbī-ṭāba/* "My-father-is-good";

oi.uchicago.edu

the verb *mataᶜa* in */Mataᶜa-ki-ᵓEl/* "He-has-protected-like-ᵓEl"; the pronoun *manna* in */Manna-baltī-ᵓEl/* "Who-is-without-ᵓEl?"; and so forth.

In a superficial analysis of such spellings as *I-la-kab-ka-bu-ú* or *Áš-du-um-la-a-bu-um* one may reach the conclusion that these names are composed of two elements, namely, *ᵓIla* plus *kabkabû* and *ᵓAšdum* plus *lābum*, and in fact the plene spellings in these and hundreds of parallel examples have regularly been taken to denote vocalic length. However, an analysis of the system of writing Amorite names, based on a complete list of all the plene occurrences, yields different results. The consistency of usage, with but very few exceptions, leads to the important conclusion that the plene spellings indicate not a long vowel but an independent syllable. Thus in the examples cited above, the correct analysis of the system of writing yields */ᵓIla-kabkabuhu/*, in which *-hu* is a bound morpheme with the meaning "his," and */ᵓAšdum-la-ᵓabum/*, in which *la* is a free morpheme with asseverative force.[14]

Consonantal clusters are expressed by means of two different signs, the first of which contains the correct vowel plus consonant, the second the correct consonant plus any vowel, which becomes silent, as in */ᶜAbd-ᵓEl/* or */ᶜAbd-ᵓIl/* "Slave-of-ᵓEl" written *Ab-da-El*, *Ḫa-ab-di-El*, or *Ab-te-Il*, */ᶜAbd-Ḥamī/* "Slave-of-Ḥamī" written *Ḫa-ab-du-ᵈA-mi*; and */Kibr-ᵓAbba/* written *Ki-ib-ra-Ab-ba*; or by two different signs containing consonant plus vowel and vowel plus consonant, with both vowels silent, as in *Ki-bi-ir-ᵈAb-ba* */Kibr-ᵓAbba/* = *Ki-ib-ra-Ab-ba* */Kibr-ᵓAbba/*.

In my analysis of the roots and stems, I tended to place under one root or stem not only the occurrences that belonged there properly but also those with some doubtful or unknown interpretation. This was done in order to facilitate the study of doubtful occurrences by comparing them with those that have an established interpretation. The degree of certainty in these cases will be clarified in *Grammar*, where doubtful interpretations will be either altogether separated from firmly established ones or will be marked by an appropriate question mark, with an annotation.

Dialectal variants have normally been treated separately. Thus the English verb "to give" is listed under both NTN and NDN, and the name of the storm god is given under *Had(d)u*, *Had(d)a*, *Hed(d)a*, *Handu*, and *Handa*, that of the chief god of the Amorites under *ᵓEl* and *ᵓIl*.

The treatment of allomorphs is not, and it could hardly be, consistent. The English conjunctions "like," "as" are expressed by either *ka* or (rarely) *ki*, depending, I assume, on dialectal distribution, as in */ᵓAḫu-ka-ᵓabī/* "Brother-is-like-my-father" or */ᵓAḫī-ki-Līm/* "My brother-is-like-(god)-Līm." The name */Bunu-ki-ᵓIl/* is listed under *ki* without prejudice as to whether *ki* is original in this name, as in */ᵓAḫī-ki-Līm/* just above, or whether it is derived from *ka* where *a* followed by ᵓ with a front vowel would become *i* through morphophonemic change. Similarly, some of the writings of the storm god Hed(d)a cited above may be examples not only of a dialectal distribution but of morphophonemic change as well.

The way in which certain roots have been assigned, baffling on the surface, can be justified by differences in the writing systems. Thus the Ur III name *Ia-gu-na-an* was analyzed as */Ja-kwun-ān/* and placed under the root KWN (*kūn*) because the sign GU can be read as *ku* in the Ur III period and it is more plausible to assign the verb to the common root KWN (*kūn*) than to the rare root ᵓGN (meaning unknown) of the examples that follow. On the other hand, the Old Babylonian name *Ia-gu-ni-im* was analyzed as */Ja-ᵓgun-im/* and placed under the root ᵓGN because the sign GU does not have the value *ku* in classical Old Babylonian and assigning it to ᵓGN can be justified by several spellings *Ia-aḫ-gu-un*. In the root ᵓGN, ᵓ can be interpreted as ᵓ, H, Ḥ, and ᶜ, and G as G or Q. (See section 0.4.)

Many elements that appear non-Amorite are included in chapters 1 and 2, "Stems" and "Roots," if they form part of clearly Amorite names. Among them are appellative nouns, such as *ᵓandull* in */ᶜAmmī-ᵓandullī/* "My-(paternal) uncle (here deified)-is-my-protection" or *kisibirr* in */Kisibir-ratum/* (feminine name) "Coriander"; and names of divinities, deified geographical names, and the like, such as *ᵓIšḫara* in */ᵓIšḫara-napšī/* "Išḫara-is-my-life" or *ᵓArapḫ* in */Mutu-ᵓArapḫim/* "Man-of-Arapḫum (here deified)." In these examples, *ᵓandullum* and *kisibirrum* may be foreign words or loanwords in Amorite; *ᵓIšḫara* and *ᵓArapḫum* may or may not have been integrated into the Amorite pantheon.

Several practical reasons led to a morphemic analysis that appears to be at variance with the one proposed in my *Sequential Reconstruction of Proto-Akkadian*.[15] In my judgment, both analyses are valid. The analysis proposed here is practical and is close to one that may be offered in a standard grammar. The analysis offered in *Sequential Reconstruction* is theoretical and (as the title indicates) is based on reconstruction.

3. *Transliteration.* The third column is occupied by the transliteration of the name, plus some additional indications. The transliteration here followed is the one generally used in Assyriology, with the following exceptions.

Semantic indicators (determinatives) are placed on the line and joined by a dash, as in D-IM-BA-AḪ-LI for ᵈIM-*ba-aḫ-li* */Haddu-baᶜlī/*. The determinatives are:

BAD_2	fortress
D (for DINGIR)	deity
ḪUR.SAG	mountain
KI	place name
KUR	land
LÚ	person
URU	town

Sumerian elements are joined by a dash rather than by a dot, as in MU-UT-D-IGI-KUR for *Mu-ut-*ᵈIGI.KUR.

14. Cf. Gelb, "Lingua," pp. 143-44.

15. Assyriological Studies, no. 18 (Chicago, 1969).

oi.uchicago.edu

Index numbers rather than accents are used to differentiate homophones. Thus U_2 is used in place of Ú.

No half-brackets (⌜ ⌝) are used in the transliteration column. In place of half-brackets, transliterations such as [L]A and L[A] are used to serve the purpose, albeit inconsistently.

In the discussions, all of these unconventional features, imposed by computer limitations, have been adapted to conform to the standard Assyriological practice. (See p. 4.)

In many cases a word or an abbreviation is added after the transliteration to help identify a particular type or form of the name. When there is no such special indication, it should be understood that the name is either masculine nominative or that nothing is known about it to define it in any other way. Occasionally a masculine name is designated MN or MN? to point out that despite its unusual form the name nevertheless is or may be masculine.

The following words or abbreviations may appear following a transliteration:

ACC	accusative
DN	name of a divinity
FIELD	name of a field
FN	feminine name
GEN	genitive
GN	geographical name
KING	name of a king
MN	masculine name
MOUNT	name of a mountain
NOM	nominative
PL	plural
RIVER	name of a river
TRIBE	name of a tribe

4. *References.* The fourth column is occupied by references, plus some additional indications. Abbreviations that appear under references are given in the "Abbreviations of Sources." Since the entries have been collected and the cards have been punched over a period of about twenty years by a number of different persons, some careful, some not, there are great variations and discrepancies in the form of the references. Moreover, the limitations in the space allotted to references in the computer program have resulted in some inconsistency in citing abbreviations and accompanying information.

Additional information that supplements the references may indicate the date, place, or kind of occurrence:

Date:	PSARG (pre-Sargonic)
	SARG (Sargonic)
	UR III
	POST-U (post-Ur III)
	CAPP (Cappadocian)
	EARLY OB (early Old Babylonian
	OLDER OB Tell Asmar texts)
	LATE (post-Old Babylonian occurrences from Alalakh IV, Ugarit, Late Assyrian, etc.)
Place:	HANA
	HARMAL
	ISHCHALI
	MARI
	QATNA
	RIMAH
	UGARIT
Kind of occurrence:	DATE (year date)
	SEAL (seal inscription)

The "UR III" indication appears with references that became known after Buccellati's publication.[16] "HARMAL," "ISHCHALI," "MARI," and "UGARIT" appear with references to publications other than the main works, such as ARMT, MRS, and the like. A reference with no supplementary indication is Old Babylonian in date and Babylonian in place. The symbol + at the end of a reference means that there are more occurrences of the name that were collected but not listed.

This ends the discussion of the structure of the first three chapters. For the discussion of chapters 4-7 see the introductory remarks to each of these chapters.

0.4. Consonantal Phonemes

The consonantal phonemes of the Amorite language are: ʾ, ʿ, *b*, *d*, *ḏ*, *g*, *h*, *ḥ*, *ḫ*, *j*, *k*, *l*, *m*, *n*, *p*, *q*, *r*, *s*, *ś*, *š*, *ṣ*, *t*, *ṭ*, *w*, and *z*. These will be fully discussed in *Grammar*. Here we will give only a few facts of relevance to the users of this volume.

The inventory of consonants includes *ḏ*, but does not include *ḍ*, *ġ*, or *ẓ*.

The consonant ʾ stands not only for the glottal stop (ʾ), but also, more frequently, for ʾ*x*, that is, an uncertain laryngeal or pharyngeal consonant, which could be *h*, *ḥ*, or ʿ.

The consonant Ḫ stands for *ḫ*, but may also include some occurrences of *ḥ* and ʿ.

The consonant Z stands for *z*, but may also include some occurrences of *s*, *ṣ*, and *ḏ*.

Without anticipating the full discussion that is to appear in the forthcoming *Grammar*, I should like to make one brief comment concerning the phoneme here symbolized as Ḏ. This phoneme represents the voiced counterpart of the voiceless interdental spirant here symbolized as Š. A consistent symbolization of this pair should therefore have been either Ṯ and Ḏ or Š and Ž. As will be evident from the material collected in *Grammar*, the support in favor of the latter pair is to be found in the phonemic analysis of Old Akkadian (see provisionally MAD 2^2, pp. 35 and 37-40), Amorite, and Ugaritic.

0.5. Alphabetic Sequence

The alphabetic sequence of the entries in the three columns varies from chapter to chapter, and also within

16. Buccellati, *Amorites*.

oi.uchicago.edu

each chapter, especially between the first or lemma column and the second or analysis column:

Alphabetic sequence

Chapter	*Lemma column*	*Other columns*
1. Stems	new order	work order
2. Roots	new order	work order
3. Prefixes and Suffixes	roman order	work order
4. Stem Count	roman order	new order
5. Phoneme Count	new order	new order
6. Index of Names	....	roman order (in col. 3)
7. Unanalyzed Names	....	work order

These discrepancies in alphabetic sequence appear more complicated than they are. Actually, since chapters 3 through 7 were derived from chapters 1 and 2, and since using the roman order was the most natural way to present the data in some of the derived chapters, the discrepancies boil down to the difference between the work order and the new order in the first two chapters.

The alphabetic order here called "work order" is the one that was followed on the pink cards and also on the punch cards (see pp. 2-3). I call it "work order" because all of my work on the analysis, certainly in the initial stages, was done on the basis of the pink cards, although in later stages, after the first sets of computer test runs began to appear, I worked from the punch cards as well.

The work order is that of MAD 3. In this order, all names are entered under the consonantal root, disregarding vowels. The stems, which consist of consonants and vowels, are listed under each root in a set order. Nouns are given in the sequence masculine and then feminine, and, under each of these, in the sequence nominative, genitive, accusative. Verbs list the finite forms (such as JAQTUL) first, followed by the verbal nouns in the order QATAL, QATIL, QATUL, QATL; QITAL, QITIL, QITUL, QITL; QUTAL, QUTIL, QUTUL, QUTL; MAQTAL; and so forth.

The alphabetic sequence that I have called "new order" is the one mainly followed in lemmata:

Roots (consonants only)							*Stems* (consonants and vowels)							
ʾ	H	Ḥ	Ḫ	ʿ	W	J	ʾ	H	Ḥ	Ḫ	ʿ	W	J	
B	D	Ḏ	G				A	B	D	Ḏ	E	G	I	
K	L	M	N	P	Q	R	K	L	M	N	P	Q	R	
S	Ś	Š	Ṣ	T	Ṭ	Z	S	Ś	Š	Ṣ	T	Ṭ	U	Z

In both orders the alphabetization of root consonants begins with the consonants which in Akkadian are called "weak," plus Ḫ, and continues with other consonants in their order in the roman alphabet, with the Semitic consonantal phonemes added. The alphabetization of the stems is the same, except that vowels are included.

N.B.: The characterization of the first seven consonants as "weak" is inappropriate for the Amorite language, as will be shown in *Grammar*.

Essentially the new order is the same as the work order except for the following deviations:

In the work order of the roots, the weak consonants appear all together (as in MAD 3), following one another, and are not separated as in the new order, where roots and stems beginning with ʾ are placed together, followed by roots and stems beginning with H, and so forth. Thus the sequence of the work order is BWʾ, BʾD, BʿD, BʾR, BʿR, while that of the new order is BʾD, BʾR, BʿD, BʿR, BWʾ.

Keeping the weak consonants together, as in the work order, is useful in the interpretation of a little-known language. This can be illustrated by one example among many. If the names transliterated as A-ZI-RUM and ḪA-ZI-RUM are placed in close proximity under the roots ʾZR and ḪZR, one can see at once that they may be related and that Ḫ of ḪA may stand for a phoneme that can be expressed also by A. This leads to the plausible interpretation of the two names as *ʿAzirum* (actually /*ʿAḏirum*/, judging from other evidence).

Another difference in the alphabetization of the roots affects the two-consonantal and three-consonantal (and four-consonantal) roots. In the work order, the two-consonantal roots are grouped together and are separated from the three-consonantal roots. In the new order, the sequence of the roots is not affected by whether they occur in a two-consonantal or a three-consonantal root.

Thus the differences in the sequence of two-consonantal and three-consonantal roots can be illustrated by the following example: ʾḪ ʾJ ʾWJ ʾḪḎ ʾWŠ ʾB ʾBQ in the work order, and ʾḪ ʾḪḎ ʾWJ ʾWŠ ʾJ ʾB ʾBQ in the new order.

The main difference in the alphabetization of the stems is as follows: In the work order, the stems are listed under each root in the morphemic order described above. In the new order, the stems are alphabetized in the same order as the roots, except that the vowels are added.

As can be seen, the differences between the work order and the new order are not serious. Each order has certain advantages. The work order has the advantage of being conducive to new and improved interpretations. The new order has the advantage of being much easier to handle in the computer program.

The justification for using the roman (plus Akkadian) order of letters in the transliteration of cuneiform signs in chapter 6, "Index of Names," is self-evident. I can foresee no objection to the use of the roman order in listing the prefixes and suffixes in chapter 3, "Prefixes and Suffixes," and the patterns or formations in chapter 4, "Stem Count."

0.6. Computer Report, by Stuart-Morgan Vance and Robert M. Whiting

Introduction. As noted above, the project on which this volume is based is a computer-assisted morphological analysis of Amorite names. The ultimate source of the data is cuneiform documents in the Akkadian language. The first step in the project was therefore the recording of these names by now-forgotten scribes several millennia ago. Some of these our earliest colleagues in this endeavor showed a good comprehension of the structure of the names, others

oi.uchicago.edu

were less perspicacious. Of course they were merely writing the names of people involved in commercial or political transactions, not trying to do a scientific analysis.

The first modern step in the project was to transcribe the cuneiform spelling of the names into morphemes of the Amorite language. This was done by I. J. Gelb. Such a task, requiring a thorough knowledge of the ancient Semitic languages and of the cuneiform writing system, cannot be mechanized at the present state of the art.

The next step was to put the transcribed names onto punch cards for input to the computer. Then a computer program was written to perform the required analysis of the morphology of the names. This program is described below.

We wish to express our appreciation to the following people who contributed to this project: First, to those ancient scribes who, by recording the names in the first place, made this project possible at all. Next, to the modern scholars, particularly I. J. Gelb, through whose patient work this mass of data was recovered. We are indebted to V. H. Yngve for instruction in the art of programing computers for nonnumerical applications. We received valuable hints and suggestions from Stephen P. Soulé and Eleanor Lewis. We are also grateful to Clive A. Church for writing the printing program; to Randall Lee, Charles Payne, and Tom Morgan for permission to use the American Library Association print train; and to Ron Skirmont for providing the carbon ribbon and bond paper for the printed output.

Structure of the Names. As noted in section 0.3, each name may consist of one, two, or three roots, each with its associated prefixes and suffixes. The term "root" applies strictly to the consonantal root. The root together with its vocalism is called a "stem."

A stem with its associated prefixes and suffixes is called an "element." Thus a name may have one of the following three structures:

element
element + element
element + element + element

Within each element there may be 0, 1, or 2 prefixes and 0, 1, 2, or 3 suffixes. The possible prefixes and suffixes are divided into mutually exclusive classes: two classes of prefixes and three of suffixes. The structure of an element is therefore the following (the parts that may or may not be present are given in parentheses):

(class 1 prefix) - (class 2 prefix) - stem - (class 1 suffix) - (class 2 suffix) - (class 3 suffix)

Punch-Card Representation of the Names for Input to the Computer Program. The names are punched one to a card. The transcription of the name begins in column 1. The transliteration of the cuneiform begins with an asterisk in column 25. References begin with a period in column 55.

The transcription is punched in the following format: the elements are separated by + signs; within each element the morphemes (prefixes, stems, suffixes) are separated by - signs.

Inasmuch as the keypunch character set does not contain all the characters normally used in transliteration and transcription of cuneiform, certain characters had to be represented by digraphs or "nearest equivalents."

The Output. Each full-name listing appears in the output as many times as there are morphemes in it: once for each stem (consonants and vowels), once for each root (consonants only), and once for each prefix and suffix. All occurrences of the same morpheme are displayed together.

A punch card is 80 characters long. The computer is capable of printing a line 132 characters long. The first item on each line (allotted 11 spaces) is the morpheme being collected, followed by a number that indicates the element in which it occurs. (Such an identifier is not repeated but applies to each successive line until a new identifier appears.) The second item on each line is the transcription in an expanded format: each element is accorded 28 spaces—class 1 prefix in the first 4 spaces of a set, class 2 prefix in the second 4, stem in the next 8, class 1 suffix in the fifth 4 spaces, class 2 suffix in the sixth 4, and class 3 suffix in the seventh 4; the transliteration and reference (65 spaces) complete the line. For one-element names the second 28-space set is left blank; for two-element names both sets are used. Three-element names are too long to fit in one line, so they occupy two: the first two elements appear side by side, as in a two-element name, and the remainder of that first line is left blank; on the next line the third element is aligned directly below the second, and the transliteration and reference(s) follow. (If there be 4 elements, the fourth is not processed. There are only four such names in the entire corpus, and it was not considered worthwhile to provide an additional routine for these *hapax phainomena*.)

In addition to these full-name listings, each consonantal root is also displayed as a function of each consonant in the root, regardless of the position of the root in the name. This information, where X is any given consonant, is given under the heading "Phoneme Count" and is displayed in the following format:

Roots containing X
First Consonant X
Second Consonant X
Third Consonant X
Fourth Consonant X
Total Roots Containing X

Under each subheading is printed a list of the roots that contain a given consonant in the designated position. After each root the count of tokens of that root is printed. At the end of each subsection for a particular consonant in a given position is printed the count of the root types, and at the end of the section is printed the total count of these root types for that consonant in all its positions.

Stem vocalization patterns are displayed in a similar format under the heading "Stem Count," but in this case the identifier is a vocalization pattern and the data show a token count of each stem with which the given pattern occurs and a type count of that pattern.

oi.uchicago.edu

Finally, an index of names is provided which presents the names ordered alphabetically by transliteration, together with the corresponding transcription and reference(s) for each name.

The Programs. The computer program that produced these results consists of six parts: 1) analysis, 2) sorting, 3) stem and phoneme count, 4) index, 5) typography conversion, and 6) printing.

1) *The Analysis Program.* The analysis program takes the data cards as input and produces intermediate files that become the input to the sorting programs. It expands the format of the transcription to that used in the output and makes as many copies of the line as there are morphemes in the name. Each such line is tagged with a code number corresponding to one of the morphemes. These numbers are used by the sorting program to sort the lines into the desired order for output. At the same time the analysis program produces a second file for the stem- and phoneme-count program. Each entry in this file consists of the consonantal-root code number and the vowel-pattern code number, to which latter is appended the full-stem code number. This file is sorted into alphabetical order by another sorting operation.

The principle of operation is as follows. One card is read at a time. Columns 25-80, the transliteration and reference(s), are placed in temporary storage, as they are not involved in the analysis. If columns 1-24 are blank, the name is recognized as unanalyzed and a sort code is assigned to it which causes the name to go to the end of the output in sorting. The name is written into the intermediate file and the next card is read. The first 24 columns (the transcription) are split apart at the + signs, and each resulting element is examined in turn. First it is checked for the presence of - signs. If there be none, then the entire element is a stem and the affix routines may be skipped. Otherwise the examination begins at the left, taking in turn each unit delimited by a - sign. Each such unit (morpheme) is checked against a list of prefixes to explore three possibilities:

1) that it is a class 1 prefix
2) that it is a class 2 prefix
3) that it is not a prefix but a stem

If 1), the morpheme that follows is also checked against the prefix list to see whether it is a class 2 prefix. If 2), the morpheme that follows is taken to be the stem. If 3), the morpheme itself is taken to be the stem. Morphemes that follow the stem are checked against a suffix list in analogous fashion.

For each morpheme (stem, root, prefix, or suffix) a code number is produced and stored, which is later used to prepare a 12-digit sort code. The code number for the stem is produced by converting each letter or digraph of the stem into a 2-digit number from 01 to 29. There are 29 letters in the alphabet used—25 consonants and 4 vowels. This code number is placed in temporary storage. For the root, the code number is produced in the same manner but the vowels are ignored. This code number is also stored but at the same time is used to prepare a 20-digit sort code which is written out into an intermediate file for use in the phoneme- and stem-count program. For the vowel pattern of the stem, the code number is generated by converting each vowel into a single-digit number from 1 to 4 and each consonant into the digit 9. To this code number a copy of the stem code is added and the resulting 20-digit sort code is written into the intermediate file for use in the phoneme- and stem-count program.

Each affix is converted into a predetermined 3-digit code number and placed in temporary storage.

After each morpheme of each element of the name has been converted to a code number, the storage shelves are checked and each code number is used to produce a 12-digit sort code which indicates the class of morpheme, how it is to be alphabetized, and the element of the name in which it occurs.

The transcription is then reassembled in the expanded format described above, and the transliteration and reference(s) are appended. A copy of this line is attached to each sort code and written into an intermediate file. Thus each morpheme in the name is identified by a sort code, with the full name and the reference(s) attached to it. This done, the next card is read and the process repeated.

2) *The Sorting Program.* The intermediate files produced by the analysis program are the input to the sorting program. This is the standard sorting program provided by IBM, which sorts the material in those files in the numerical order of the code numbers produced by the analysis program. The code numbers have been designed to produce the desired alphabetization of the morphemes and their grouping into classes. The sorted outputs appear as further intermediate files on a tape.

3) *The Stem- and Phoneme-Count Program.* The phoneme-count program was adapted from one devised by Peter T. Daniels. The analysis program produces a file of the code numbers for consonantal roots and of root vocalism codes without the appended print line.

Upon sorting, the two classes of code numbers are separated, and each appears in alphabetical order. This sorted file is used as input to the counting program. Depending on whether the first digit be a 1 or a 2, the code number is recognized as a consonantal root or as a vowel pattern. This first digit is then deleted and the remainder is processed according to the class to which it belongs.

In the case of a consonantal root, the consonants are indicated by 2-digit numbers from 01 to 29. Pairs of digits are checked by a list rule and given appropriate subscripts (101 to 125—the four vowels have been deleted). These subscripts are then used to file copies of the root so that they are arranged on shelves 1 through 100 according to the following pattern: 76 through 100 have roots arranged in order by the first consonant ʾ through Z; 51-75 are arranged in similar order by the second consonant; 26-50 in similar order by the third; and 1-25 in similar order by the fourth. (There are no roots with five or more consonants.)

oi.uchicago.edu

The subsequent part of the phoneme-count processing counts the number of roots that contain each consonant in each possible position (first through fourth).

After the consonantal phoneme count is completed, the vowel patterns are counted in an analogous manner. The code number in this case has the full stem code appended so that the stems can be printed out. The printed format is similar to that used for the consonantal phonemes.

These count programs supply a file for input to the printing program.

4) *The Index Program.* The index program is a simple three-part program which prepares the transliteration section of each punch card (cols. 25-54) for alphabetization by deleting all determinatives (semantic indicators) and other phonetically nonsignificant characters such as brackets, question marks, and ellipses; sorts the transliterations into the desired order; and converts the original punch-card characters for input to the printing program while adding a line number for each entry.

5) *The Typography-Conversion* and 6) *Printing Programs.* Although these are separate steps, they may be more readily understood if considered together. The printing program is a routine to drive the American Library Association train from the ordinary character set available on the key punch. The print train designed by the ALA contains all the characters needed for the conventional transliteration and transcription of cuneiform. This allows the printing of the output in orthography familiar to Orientalists. Each ALA-train character for output is represented by a digraph on the input. The typography-conversion program makes the appropriate input string for the printing program. Using the sorted morpheme file from the analysis program as input, the typography-conversion program produces the output lines in digraph representation. The code number at the beginning of each line is reconverted to the morpheme it represents by the inverse of the process used by the analysis program to produce the code number. The regenerated morpheme is then printed as an identifier at the beginning of the line.

The output of the typography-conversion program is written on tape. This tape then serves as input to the printing program which produces the printed output. The output of the phoneme- and stem-count and index programs is also used for input to the printing program.

0.7. Glossary

This glossary is presented here as a guide to the morphology and semantics of the computer analysis. The choice of entries is eclectic, and therefore this glossary should not be considered a replacement for the glossary with a full critical apparatus which is to be published later (see p. vii).

From the standpoint of methodology, the decipherment of the Amorite language can be classed as the recovery of an unknown language, on a par with the decipherment of Etruscan, for example. Since in both these cases the writing is known, being cuneiform in the case of Amorite and close to Latin in the case of Etruscan, we are dealing not with a true decipherment, but rather with a linguistic analysis. Luckily, unlike Etruscan, the Amorite language does not stand in complete isolation, as it is closely related to other Semitic languages. Since there are no Amorite texts and no bilinguals, we must rely entirely in our analysis of Amorite on two external processes, comparison with the grammar of other Semitic languages and comparison with the structure of Semitic personal names in general. These processes are much more reliable for the recovery of morphology than semantics. As a result, while the morphology of Amorite is rather well established, the semantics is not, and will remain uncertain until the discovery of extensive lexical or bilingual texts. The following examples will illustrate the problem. Do the verb and the verbal nouns listed under the root ʾMR mean "to see," as in Akkadian, "to say," as in Hebrew, or "to command," as in Arabic? Is the name written *In-bu-um* to be interpreted as *ʾinbum* "fruit" or *ʿinbum* "vine"?

In selecting certain forms and meanings, I was generally guided more by the likelihood of their occurring in personal names than by their overall occurrence in different Semitic languages, be it West or East Semitic. Thus the name */ Manna-baltī-ʾEl/* is interpreted here as "Who-is-without-ʾEl?" on the basis of such parallels as */ Manbalūm-Dagan/* "Who-is-without-Dagan?" in Akkadian or */ Mī-kā-ʾEl/* "Who-is-like-ʾEl?" in Hebrew, and not as "What-is-without-ʾEl?," as proposed by some scholars on the basis of the occurrence of the pronoun *mā* "what?" in Hebrew. An acquaintance with the structure and semantics of Semitic names is a condition *sine qua non* for the correct analysis of the Amorite names.

Entries are organized in two ways, under consonantal roots and under stems consisting of consonants plus vowels. Under roots are found verbs and verbal nouns. Occasionally, related nouns not necessarily of verbal origin are grouped together under a single root for convenience in citation. Under stems all the verbal nouns are listed again, and also primary nouns, primary adjectives, pronouns, and geographical and royal names and names of divinities.

Verbs are organized by stems in the following order: B (basic, Qal), BT, BH, BN, D (double, Piel), DT, Š, ŠT (BŠT), and DŠT.

Because of the uncertainties of cuneiform writing, verbal nouns are often cited with no indication of length and consequently no translation. Thus a form listed as *qatilum* may stand for *qatilum*, *qātilum*, *qatīlum*, and even *qattilum*. (See also p. 6.)

Verbal nouns with the extended stems *-ān*, *-ānum*, *-atān*, *-atānum*, *-atum* (in masculine names), and *-ja* are generally not cited as separate entries because of uncertainties as to whether these bound morphemes belong to the morphology of names or of the language. Exceptionally, some names with an extended stem are included, such as */ Qaqqadān/* "man with a large head," from *qaqqadum* "head."

oi.uchicago.edu

Names of the *jaqtulum* formation are generally taken to be hypocoristica of fuller *jaqtul-* names, but they may also represent a deverbal formation in geographical names of tribal origin, as in */Japṭurum/* or */Jaᵓrurum/*. Names marked as feminine may either represent nouns occurring in the feminine gender or they may form part of the morphology of feminine names, as in the feminine names */Kabkaba/* "Star" or */Kisibir(r)atum/* "Coriander."

Two or more translations of an entry are separated by commas when the meanings are similar (e.g., *bāšum* "shame," "ashamed"), by semicolons when the meanings are unrelated (e.g., *bābum* "gate"; "baby").

I can only repeat here the warnings given above concerning the uncertainties of the phonemic reconstruction (see p. 8) and of the definition of the term "Amorite" (see pp. 1-2).

All entries are listed in the order of the roman alphabet, with certain Semitic phonemes added:

1. STEMS

The stem, composed of consonants and vowels, is the basic free morpheme of a word without its bound morphemes. It occurs in primary nouns, as in *kalb* of */ Kalb-um/* "dog"; in several classes of primary conjunctions, prepositions, etc., as in *ka* "like," "as," or *la* of */ La-na-/* "to us"; and also in the verb and verbal noun *rpaˀ* or *rāpiˀ* of */ Ja-rpaˀ+/* or */ Rāpiˀ-um/* from the consonantal root RPˀ "to heal."[1]

For a general discussion of the structure of this chapter and also for a discussion of points of questionable stem analysis see section 0.3.

Consonantal phonemes are discussed briefly in section 0.4.

1. See Ignace J. Gelb, *Sequential Reconstruction of Proto-Akkadian*, Assyriological Studies, no. 18 (Chicago, 1969) and I. M. Diakonoff, "Problems of Root Structure in Proto-Semitic," *Archiv Orientální* 38 (1970), pp. 453 ff.

As will be seen in the introductory remarks to chapter 4, "Stem Count," there are 1,996 consonant-plus-vowel stems.

The alphabetic order of lemmata is the new order of stems:

ˀ	H	Ḥ	Ḫ	ˁ	W	J	
A	B	D	Ḏ	E	G	I	
K	L	M	N	P	Q	R	
S	Ś	Š	Ṣ	T	Ṭ	U	Z

The alphabetic order of parts outside of the lemma is that of my earlier, so-called work order, which is not much different from the new order given above.

For the discussion of the alphabetic sequences see section 0.5.

2. ROOTS

The root lemmata are derived from the stems in chapter 1, "Stems," by omitting all vowels.

According to the definition proposed by me[1] and by Diakonoff,[2] the consonantal root appears only in verbs and in nouns derived from verbs (verbal nouns), as in */Jarpaʾ+/* and */Rāpiʾ-um/* from the consonantal root RPʾ "to heal."

The reduction of stems to roots by computer analysis, however, resulted in the listing of not only verbs and verbal nouns but also of several classes of primary elements with an artificial consonantal root analysis. Among the latter are KLB in */Kalbum/* "dog," ʾNK in */Anāku-ʾila-ma/* "I-am-truly-god," and foreign names, as in ʾŠḪR for the divinity *ʾIšḫara* in */ʾIšḫara-napšī/* "ʾIšḫara-is-my-life."

For a general discussion of the structure of this chapter and also for a discussion of points of questionable root analysis see section 0.3.

1. *Sequential Reconstruction of Proto-Akkadian*, Assyriological Studies, no. 18 (Chicago, 1969), p. 164.

2. I. M. Diakonoff, "Problems of Root Structure in Proto-Semitic," *Archiv Orientální* 38 (1970), pp. 453 ff.

Consonantal phonemes are discussed briefly in section 0.4.

We find that there are 1,020 consonantal roots altogether, distributed among 1,996 consonant-plus-vowel stems. See the introductory remarks to chapter 4, "Stem Count."

The alphabetic order of lemmata is the new order of roots:

ʾ	H	Ḫ	Ḫ̆	ʿ	W	J
B	D	Ḏ	G			
K	L	M	N	P	Q	R
S	Ś	Š	Ṣ	T	Ṭ	Z

The alphabetic order of parts outside of the lemma is that of my work order, which does not differ much from the order given above.

For the discussion of alphabetic sequences see section 0.5.

3. PREFIXES AND SUFFIXES

The lemmata correspond to the prefixes and suffixes of the analysis column given in chapter 1, "Stems."

For a general discussion of the structure of this chapter see section 0.3. Two important points are noted there: that the morphemic analysis of the prefixes and suffixes in the present study does not correspond to the results that can be obtained on the basis of the sequential reconstruction; and that because of space limitations imposed by the computer program, certain morpheme sequences are run together. Thus the two suffixes ATAN UM appear as ATANUM, and ANIJ I as ANIJI. The correct segmentation of the two suffixes can be reconstructed by noting the columns in which they appear.

There are 16 prefixes in ranks 1 and 2, and 47 suffixes in ranks 1, 2, and 3—altogether 63 prefixes and suffixes.

PREFIXES

Rank 1

ʾA	Conjugational prefix; nominal formative
ʾU	Conjugational prefix
JA	Conjugational prefix
JE	Conjugational prefix
JI	Conjugational prefix
JU	Conjugational prefix
MA	Participial prefix; nominal formative
ME	Participial prefix; nominal formative
MI	Participial prefix; nominal formative
MU	Participial prefix; nominal formative
TA	Conjugational prefix; nominal formative
TU	Conjugational prefix

Rank 2

N	N-stem (BN)
Š	Š-stem
ŠT	ŠT-stem (BŠT and DŠT)
T	T-stem (BT and DT)

SUFFIXES

Rank 1

AH	Noun/verb, feminine suffix
AJ	Noun, gentilic formative
AJIT	Noun, gentilic formative *-aj-* + feminine gentilic *-īt*
AK	Name formative
AN	Noun/name formative *-ān-*
ANIJ	Noun/name formative *-ān-* + gentilic *-ij*
AT	Noun/verb, feminine suffix; name, masculine formative
ATAN	Noun/name formative *-at-* + noun/name formative *-ān*
ATEN	Noun/name formative *-at-* + noun/name formative *-ēn*; hapax
ATIJ	Noun/name formative *-at-* + gentilic *-ij*; hapax
IJ	Noun, gentilic formative
IN	Noun/name formative
IT	Noun, feminine gentilic *-īt*
ITAN	Unclear; hapax
ITIJ	Unclear; hapax
T	Noun/verb feminine suffix; name, masculine formative
UN	Noun/name formative
UT	Unclear
UTAN	Unclear; hapax

Rank 2

A	Declensional suffix; many other functions
AJA	Name formative
AM	Declensional suffix; other functions
E	Declensional suffix; other functions
EJA	Name formative
EM	Declensional suffix
I	Declensional suffix; pronominal suffix
IJA	Name formative
IJAN	Name formative *-ija-* + name formative *-ān*
IM	Declensional suffix
U	Declensional suffix
UJA	Name formative
UJAN	Name formative *-uja-* + name formative *-ān*
UM	Declensional suffix

Rank 3

HA	Pronominal suffix
HU	Pronominal suffix
JA	Pronominal suffix
JE	Pronominal suffix
K	Pronominal suffix
KA	Pronominal suffix
KI	Pronominal suffix
NA	Pronominal suffix
NI	Pronominal suffix
NIA	Pronominal suffix
NIE	Pronominal suffix
Š	Declensional suffix *-iš*, *-aš*, *-uš*
TA	Conjugational suffix; hapax
TI	Conjugational suffix

The alphabetic order of lemmata is that of the roman alphabet.

The alphabetic order of the parts outside of the lemma is that of my work order, discussed in section 0.5.

4. STEM COUNT

The aim of this chapter (originally called "Root Vocalism") is to present a synthetic picture of all formations or vocalic patterns that occur in Amorite stems. For the definition of "stem" see introductory remarks to chapter 1, "Stems."

Each entry consists of three parts:

1) Lemma, indicated by small consonants and capital vowels, as in cA, cAc, cAcAc, corresponding to the patterns indicated by other scholars as QA, QAT, QATAL or *qa*, *qat*, *qatal* or the like.

2) Stem, plus the number of occurrences of that stem. Thus the stem KA occurs in 10 names (including variants) and ʾAḪ occurs in 116 names (including variants).

3) Total number of different stems listed that have a given pattern (not the number of occurrences), and the number of times that pattern occurs in the form of a particular stem. Thus the pattern cAcAc occurs in 240 stems. While the main aim of the computer was to count the number of *tokens* (occurring in 240 stems) by *type* (the pattern cAcAc), it also counted the number of its occurrences under each stem, as in the stem *maraṣ*, which occurs in 14 names.

For questionable stem analysis see section 0.3.

Consonantal phonemes are discussed briefly in section 0.4.

We find that there are 1,996 stems altogether, distributed among 1,020 consonantal roots. See also the introductory remarks to chapter 2, "Roots."

The most common patterns are:

cAcAc	240	cIcc	165
cAcIc	225	cUcAc	94
cAcUc	98	cUcIc	15
cAcc	298	cUcUc	74
cAccAc	26	cUcc	144
cIcAc	55	ccAc	67
cIcIc	38	ccIc	146
cIcUc	21	ccUc	97

The lemmata are given in the order of the roman alphabet with some grouping by classes. The stems are listed in the new order discussed in section 0.5:

ʾ	H	Ḥ	Ḫ	ʿ	W	J	
A	B	D	Ḏ	E	G	I	
K	L	M	N	P	Q	R	
S	Ś	Š	Ṣ	T	Ṭ	U	Z

5. PHONEME COUNT

This chapter presents the frequencies of consonantal phonemes as these appear in roots and stems, but not in prefixes and suffixes. If we were to include the 63 prefixes and suffixes discussed in chapter 3, the totals would be mainly affected by the inclusion of the phonemes *j*, *t*, and *n*, and, to a much lesser extent, *m*, *k*, *š*, ʾ, and *h*.

Statistics for each consonant are given in four parts, according to whether the consonant occurs in the first, second, third, or fourth position of a root.

Each root is listed under one of the four positions, and the total number of occurrences of that root is indicated. Thus the root ʾHL occurs in 14 names (including variants) and the root ʾḤ occurs in 116 names (including variants).

Each grouping of roots is followed by the number of times each consonant occurs in a given position in a different root. Thus ʾ occurs in the first position in 121 different roots, and in the second position in 105 different roots.

At the end of a section dealing with a given consonant is given the total number of occurrences of that consonant in all four positions in different roots. Thus the consonant ʾ occurs in 270 different roots—in 121 of them in the first position, in 105 in the second position, in 44 in the third position, and in 0 in the fourth position.

While the main aim of the computer was to count the number of *tokens* (occurring in 270 roots) by *type* (the consonant ʾ), it also counted the number of its occurrences under each root, as in the consonantal root ʾHL, which occurs in 14 names.

For the discussion of points of questionable stem and root analysis see section 0.3.

Problems connected with the definition of consonantal phonemes are discussed briefly in section 0.4.

Taking into account the difficulties of stem, root, and phoneme analysis, we find some very interesting points of statistical significance. Without commenting on them, I present below five small tables only, one showing the overall frequencies of Amorite consonants and the others the frequencies of consonants in each of the four positions. The symbols + or - after a number indicate that, because of uncertainties of phonemic analysis, the actual number is likely to be larger or smaller than the one here given. I do not need to stress that statistical data are of fundamental importance in the decipherment of unknown writings and languages of Semitic peoples.

The frequency order of consonantal phonemes is:

r	274	*š*	103
n	273	*p*	83
ʾ	270-	*q*	80+
b	228	*g*	77-
m	223	*w*	74
l	207	ʿ	51+
k	177	*ḫ*	43+
d	148-	*ṭ*	32+
t	147	*ṣ*	30+
ś	133	*s*	28+
j	125	*ḏ*	14+
z	122-	*h*	14+
ḥ	120-		

The frequency order of consonantal phonemes in first position is:

ʾ	121-	*l*	32
k	82	*p*	32
b	74	ʿ	29+
n	68	*g*	29-
ś	66	*q*	26+
m	66	*ḫ*	21+
ḥ	61-	*w*	16
t	56	*ṣ*	15+
z	44-	*ḏ*	11+
j	43	*ṭ*	8+
d	38-	*s*	7+
r	34	*h*	4+
š	34		

The frequency order of consonantal phonemes in second position is:

r	109	*ḥ*	28-
ʾ	105-	*j*	28
n	90	*p*	27
m	87	*g*	23-
l	79	*q*	21+
b	77	*ṭ*	18+
k	47	*ḫ*	12+
d	43-	*s*	11+
w	42	ʿ	8+
t	40	*ṣ*	8+
ś	37	*h*	6+
z	35-	*ḏ*	2+
š	33		

oi.uchicago.edu

The frequency order of consonantal phonemes in third position is:

r	111	*ś*	29
n	98	*ḫ*	28-
l	85	*g*	24-
b	71	*p*	23
m	68	*w*	16
d	64-	ʿ	14+
j	53	*s*	10+
t	50	*ḥ*	10+
k	45	*ṭ*	9+
ʾ	44-	*ṣ*	7+
z	41-	*h*	4+
q	33+	*ḏ*	1+
š	33		

The frequency order of consonantal phonemes in fourth position is:

r	20	*ś*	1
n	17	*t*	1
l	11	*ṭ*	1+
b	6	ʾ	0
ḫ	3-	*h*	0+
d	3-	*ḥ*	0+
k	3	ʿ	0+
š	3	*w*	0
m	2	*ḏ*	0+
z	2-	*q*	0+
j	1	*s*	0+
g	1-	*ṣ*	0+
p	1		

The lemmata and roots are given in the new order of roots discussed in section 0.5:

ʾ	H	Ḥ	Ḫ	ʿ	W	J
B	D	Ḏ	G			
K	L	M	N	P	Q	R
S	Ś	Š	Ṣ	T	Ṭ	Z

6. INDEX OF NAMES

This chapter contains a complete list of all the names in the order of their transliteration. The chapter is meant to facilitate reference to the analyses offered in other chapters of this volume.

Each entry consists of three columns:

1) Analysis of the name, preceded by a sequential number that refers to the transliteration given in the second column. The numbers, useful for future citations, are irrelevant for other chapters of this volume.

2) Transliteration of the name, plus some auxiliary indications, as discussed in section 0.3.

3) Reference(s), plus some auxiliary indications, as discussed in section 0.3.

In form, this index is almost identical with the list produced in 1966-67 (see p. 3), but does not have the detailed columns of analysis that appear in the first three chapters (see p. 4).

The order of the index of names is that of the roman-alphabet transliterations of the cuneiform signs as the transliterations appear in column 2, disregarding the semantic indicators (determinatives) but not the index numbers of the homophonous signs.
